The mineral surface is better and more durable than many coats of paint.

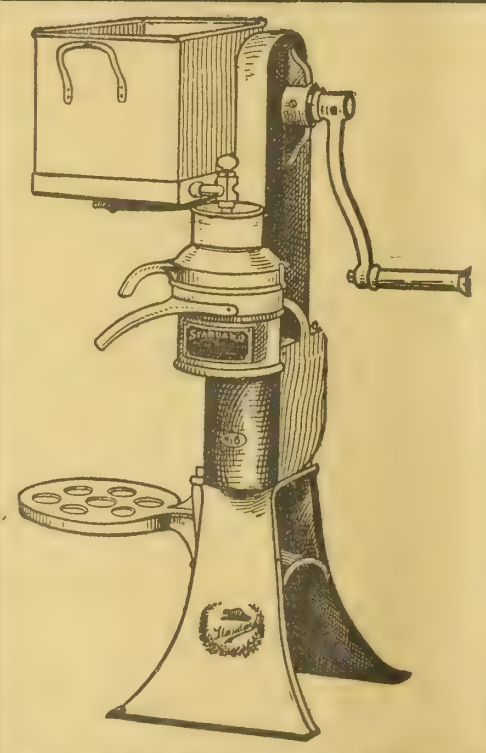
Back of the mineral surface is a layer of pitch, the greatest waterproofing compound known. Back of the pitch is a layer of felt (a whole ready roofing in itself), and behind this is another layer of pitch and another layer of felt. The result is a strong, durable roof which can take care of itself in any climate without painting.

We will be glad to send you free a sample of Amatite Roofing so that you can see for yourself just what it looks like. Address our nearest office.

Everjet Elastic Paint
Low in price. Great in durability. Invaluable for prolonging the life of ready roofings, fences, iron work, etc.

Creonoid Lice Destroyer and Cow Spray
It will keep flies away from the cows. It will keep lice and nits away from the poultry, make everything sanitary and increase their output.

The Carritte-Paterson Mfg. Co. Limited
St. John, N. B. Halifax, N. S.



"THE STANDARD"
IS THE WORLD'S GREATEST SEPARATOR

The **"Standard"** is the nearest approach to Cream Separator perfection ever accomplished, not only in skimming but in every way. It is constructed on approved mechanical principles and materials of the highest standard only are used. Its cost is very little higher than ordinary machines and its productivenes is 25% to 40% greater than the old method of skimming and 10% to 25% over all other separators.

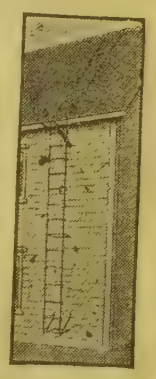
PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to-day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Agents Wanted!

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Steel Ladder.



It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co., Sussex, N. B.

Chamberlain's Stomach and Liver Tablets gently stimulate the liver and bowels to expel poisonous matter, cleanse the system, cure constipation and sick headache. Sold by all dealers.

was sufficiently matured, when we hogged down twelve acres, charging up the clover pasture at $15 per acre and all other feed at full market price, the transaction yielded us a net profit of $981.—W. M. Phillips, Ontario.

Salt The Sheep.

It is always best to have salt where the sheep can have access to it. A salt box under cover so as to keep it free from rain saves waste of barrel salt. Sheep will very soon learn to go to the salt supply for a lick of salt, as the appetite craves it. This is just as it should be, otherwise sheep getting salt once a week are liable to injury by getting too much, or may be a little late in getting to the salt when it is thrown down and not get a taste, the greedy ones getting it.

Some prefer rock salt, placing this under cover of shed so as to save waste by rains, though this is scarcely necessary as it is a very durable quality of salt and economical where salt is provided in the pasture. The nearer the sheep is placed in reach of all its requirements —grass, water and salt—the better it will do—grow, fatten and prove a profitable investment.

The Calf in Fly Time.

It is a cruel practice to subject calves to the hot sun and the torments of flies during hot weather; yet it is a very common thing to see calves tied out in the hot sun all day long and where they have to pant to get their breath. A combination of the heat with the fly pests is sufficient to cause any animal not to do well, and often they cannot even hold their own.

I just read the above in a United States paper, and the ideas here expressed are my sentiments exactly. How many poor little runts of calves we see running around the pastures these hot days fighting with the flies, suffering from heat, and not a bit of shade except such as is afforded by a rail fence. I always have a feeling of satisfaction when I see calves kept under such conditions and then think of our calves at home in a cool basement stable, with no flies to bother them, putting on flesh and preparing to make good records at the pail in the not very distant future.

It is cruel to force the calves to fight with flies and swelter in the heat. I have another reason as well for not following such a practice on my farm. It doesn't pay The calf of today is the dairy producer of tomorrow. Whether male or female, the start that they are making now determines their usefulness later on. The bull calf that is stunted in his youth is never a very satisfactory sire. We all know that a strong, vigorous, well grown heifer makes the best cow.

I prefer fall calves to spring, because we can then give them, in the first few months of their life, ideal conditions to make a vigorous growth. What calves do come in the spring, however, are not turned on pasture till three or four months old and then the orchard is utilized as a calf pasture. Here there is shade in abundance. Water is supplied to them a couple of times daily. They get thirsty in hot weather the same as we do, and need a drink in addition to the skim milk supplied. When kept in the stable they are offered water once a day.—L. C. Smith in Farm and Dairy.

This Man is Young at 55 Years.

He is a "Health Belt Man;", therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly Strength; it makes you young and keeps you young all the days of your life; it takes all the coward out your make-up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you?

The secret of life-long youth may be summed up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none. Just the Health Belt. No privations, no dieting and no restrictions, excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send its power into your nerves, organs and blood while you are sleeping. It gives you a great flow of soft, gentle, galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; it gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient. S Coolen, Hubbards Cove, N. S., writes: "I am a man again, thanks to you. Nothing can discourage me now." This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount or cash if you prefer to deal that way.

These Nature Cure Books FREE

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's

Caustic Balsam

IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Interior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Diphtheria, Sore Lungs, Rheumatism and all Stiff Joints

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

REMOVES THE SORENESS--STRENGTHENS MUSCLES

Cornhill, Tex.—"One bottle Caustic Balsam did my rheumatism more good than $120.00 paid in doctor's bills." OTTO A. BEYER

Price $1.50 per bottle. Sold by druggists, or sent by us express prepaid. Write for Booklet B.

The LAWRENCE-WILLIAMS COMPANY, Toronto, Can.

THE HORSE.

Contracted Feet.

Subscriber, Fredericton, N. B.:— I have, a four-year-old mare whose feet are contracted making her somewhat lame. She was all right until three years old. Is there any remedy and would it be all right to breed her?

Ans.—The contraction may be due to navicular disease or the result of corns. In either case good treatment would be to have the feet carefully levelled by a competent horse shoer and then poultice with warm poultices, changing night and morning, for five days and cleaning the feet well each time poultice is changed. Boiled turnips or flax seed makes a good poultice. Any substance that retains heat and moisture is suitable. After poulticing clip the hair off around foot above hoof for three inches and rub in a blister made by mixing two drams of Mercury Binoiodide, four drams of pulverized Cantharadies and two ounces of Vaseline. Tenty-four hours after applying, grease and twenty-four hours after that wash off and grease again. While the blister is on tie the head to keep the animal's nose from the blister and when the scab heals off give the animal a run to grass in a reasonably soft pasture. Have shoes off or shoe with low thin shoes without caulks to allow good frog pressure. Breed to a good sire of her class being careful that he has good feet and legs and she should produce a colt that will be an improvement on herself.—J. Standish, V. S.

Sweeny in Horses.

Sweeny is a very common derangement, especially in young horses when first put to work in the soft ground in the fields, or deep snow in winter. In such conditions the horse has to lift his legs high and if he is drawing a load the muscles of the shoulders are liable to be strained. The question is frequently asked: "Why do the muscles waste after they have been strained?" Muscles do not always waste after being strained, it is only when the nerves supplying the muscle or muscles have been injured by the strain that wasting takes place. In some cases the nerves may be so injured as not to be able to perform their function for a time at least, causing complete paralysis of the muscles. In such a case the derangement is incurable, therefore, when we know what sweeny is we also know what can be done to cure it.

In the early stages of the derangement there is sometimes swelling and heat in the muscles, and lameness. In such a case the animal should not be moved out of the stable and the swollen part should be bathed well three times a day with the following until the swelling and lameness disappear: Mix one ounce acetate of lead with one quart of water and shake up well. Very often there will not be any swelling or lameness and the first thing noticed will be wasting of the muscles and the treatment of this form of sweeny should be of a stimulating nature for the purpose of stimulating the nerves that have been injured, into a healthy condition. The stimulating treatment will also increase the flow of blood to the part and this combined action will cause the wasted muscle or muscles to develop. The best treatment for this purpose is to mix four drams of cantharides with three ounces of lard and rub a little on the wasted part once a week and continue it until the wasted part is filled up.

To Teach a Colt to Back.

Stand on the ground behind the breaking colt and pull hard, but steadily, upon the reins, saying, "Back! Back!" This, of course, the colt does not understand, and he will resist the pulling for some time, but finally, to relieve the pressure on his mouth, will take a step or a half-step backward. Watch him closely for the sign of compliance, and the moment it is shown release the pressure on the bit, then repeat the lesson.

Remember that the secret of success is in releasing pressure the very instant a backward movement is made. For if you keep on pulling, you do not convey to his mind any intelligible idea of what you want of him. But by releasing pressure the colt soon learns that he can escape the painful pressure on his mouth by simply stepping backward and is prompt to avail himself of the privilege.

When he will back nicely in this way, get onto the breaking colt and repeat the lesson. Don't make your lessons too long, but have them short and oft repeated, and always take pains to pet up the colt just after he has yielded cheerfully to what you require of him. In this way the recollection of his obedience keeps in his mind.

I have heard it said that "it takes a year to teach a colt to back," but I have never yet seen a colt that could not be taught to back in thirty minutes and often in less time, if the right methods were used.—Reader.

Horse Rations.

In the United States artillery and cavalry, a horse weighing from 1,000 to 1,200 pounds is given 12 pounds of oats, corn or barley, and about 14 pounds of hay per day. In Germany ten pounds of oats and 5.5 pounds of hay and 7.7 pounds of bright straw make the daily ration for the cavalry horse. On common duty, the English cavalry horse receives 10 lbs. of oats, 12 pounds of hay and 8 lbs. of straw per day. On severe duty the daily grain ration is increased to 12 or 14 pounds.

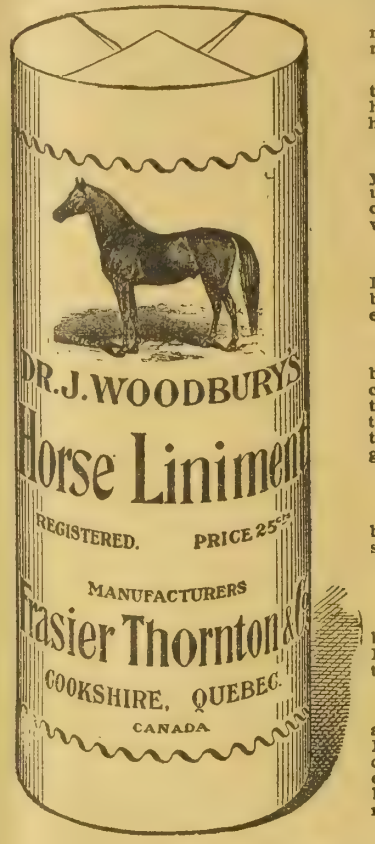
It can be seen that about one pound of grain and a trifle over one pound of hay are fed for each 100 pounds weight. Authorities on draft horses think that 0.8 pound of grain and one pound of hay each day for each hundred pounds of weight are enough for the draft horse. This would mean about twenty ears each day for the 1,600 pound horse, or a little over six ears at a feed. This is for moderate work. For hard work, the ration should be increased to eight or ten moderate sized ears. The amount of hay should be left to the appetite of the horse, but it should never be over two pounds for each 100 pounds of live weight.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affect ons of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an applicatiou of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.



Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs :—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs :—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly, C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs :—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs :—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

Dear Sirs :—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

E. J. ANDERSON, Truro, N. S.

Manufacturers :
Fraser Thornton & Co., - Cookshire, Que., Can.

Timothy for Roadsters.

The ration for the driving horse should be different from that of the average work horse. They should be fed much less roughage in proportion to their size than horses at ordinary work. The roughage should also if possible be of a different nature. The driving or saddle horse must have plenty of endurance, thus, must be fed roughage which will not in any way cause "washiness" as it is generally called. In this respect timothy hay seems to answer the purpose better than any other. Good pure clover hay is too loosening.

The Chicago Live Stock Journal makes some valuable suggestions concerning the finishing of horses for market. It says:

Every 100 pounds of additional weight in the case of a heavy draft horse is worth from 20c to 50c more per 100 pounds when you want to sell. The farmer is in a position to feed as cheaply as any professional feeder, for there are very few farmers who cannot feed so as to produce fat. To sell well on the market, horses must be fat, sleek and well groomed. The buyers demand fat. If one has time to give proper exercise and light work he can add something to the value of the horse, as he will be ready to go right into heavy work for the city buyer. A little additional grooming, together with blanketing for a month, will also add a good bit to the selling price.

ABSORBINE

Will reduce inflamed, strained, swollen Tendons, Ligaments, Muscles or Bruises, Cure the Lameness and stop pain from a Splint, Side Bone or Bone Spavin. No blister, no hair gone. Horse can be used. $2 a bottle delivered. Describe your case for special instructions and Book 2 E free.

ABSORBINE, JR., the liniment for mankind. Reduces strained, torn ligaments, enlarged glands, veins or muscles—heals ulcers—allays pain. Price $1.00 a bottle at dealers or delivered.

W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca.

MAXWELL'S
HIGH SPEED
CHAMPION

has the largest opening of any washing machine. Practically the whole top opens up because the wringer attachment is on the side. No other washer washes clothes so quickly—so well—so easily. Tub made of Red Cypress—will last a lifetime. In every respect, the "Champion" is the champion of all washing machine.

If you want quality butter, use Maxwell's "Favorite" Churn.

POULTRY.

Preparation of Table Poultry.

Chickens destined for the table should be fed principally on nourishing soft food from an early stage of their existence, but be allowed as free a range as possible, in order that their frames may become well developed. After they have reached the age of fourteen weeks, more or less, according to the breed and season, it will be time that some attention should be given to them with the object of getting them fattened or finished off. It may be that if they have been well cared for they are already in fair condition; but it is wonderful what an improvement can be effected in a short time by fattening in the final stages. The term "finishing off" really expresses the poultry-keeper's object better than the word "fattening", for it is not so much desired actually to fatten the birds as to improve their condition, increasing the amount of flesh on their bodies generally, and on their breasts particularly. With this object, then, the chickens should be confined to a small run, or, better still, in a semi-dark shed, in batches, in cages or coops raised off the ground. The length of the period of this close confinement must depend upon the course that is adopted. For about the first ten days the chicks, which should have been previously by no means overfed, should be allowed to eat their fill of solid food from troughs, just as much food and no more than they can eat being provided at each meal. Two or three meals a day is sufficient, but if food is left to be consumed between the meals, the birds will soon sicken of it and fail to thrive. After about ten days of this system they will probably begin to lose their appetites when they must be promptly killed, or further fattening by cramming for another week or ten days. It is doubtful whether they would improve much more by being crammed, whether by hand or machine, unless or until the crammer has gained considerable experience. The great points in cramming are to give just a cropful of food, and not to feed again until the crop is quite empty. It will be hard to find anything more suitable for finishing the chickens off with than some ground oats and skimmed milk, to which butchers' fat may be added in increasing quantities towards the end of the process. Grit must always be provided, and boiled nettles may be advantageously given occasionally to help to keep the birds' blood cool.

All birds should be starved for twenty-four hours before killing, in order that their crops and intestines may be free from food, so that they can be hung if desired without being drawn, and that they may be less objectionable to draw. The actual killing presents a serious difficulty to many poultry keepers, especially to beginners; nor is this to be wondered at, for confidence can only be gained by experience, and lack of either may cause needless suffering. Undoubtedly the most satisfactory way of killing poultry is by dislocating the neck; this method is painless, instantaneous, and cleanly. The bird should be held by the legs close to the hocks in the left hand, and the right hand placed on the head, the fingers on the top of the head, the thumb beneath the throat; the bird is held back upwards, the thumb is then pressed on the throat, at the same time the head being jerked back and the neck stretched, when, if properly done, the neck will be instantly dislocated. There is no real difficulty, confidence on the part of the operator being the chief requirement.

Early Moulting.

It is a great advantage if fowls can be induced to moult early in the season. The natural time for fowls cast their feathers is during August and September, but eggs are likely to be more plentiful next autumn and winter if the birds moult a month or six weeks earlier. If they do not commence to cast their feathers till the summer is well advanced, and it should happen to be a wet season, the period is greatly prolonged, so much so, in fact, that the birds have not completed the change ere the cold weather sets in. About the first week in June the food supplied to the stock birds should be reduced both in quality and quantity, and this will have the effect of hastening the moult by several weeks. When the first feathers are observed to drop the low diet must be stopped at once and more nutritious foods provided. Of course, it is very necessary to reduce the fowls' systems gradually and to cease the moment the feathers commence falling. This reduction may easily be overdone, in which case the birds are likely to suffer very considerably.

The Young Stock.

Hatching is now practically over for a few months, and attention should be concentrated on the young birds. The chief thing is to keep them growing well and vigorously, for once a chicken stops developing one may be pretty sure that there is something wrong somewhere. Steady, even though it be rather slow, growth is what should be aimed for, and the birds should be watched carefully to see that this is happening. A very trying period in the life of a chicken is during the time the feathers are forming, and when a large portion of the food is required for the building of the frame. During this period they require the utmost attention, without which they will either pine away and die or else fall sick, entailing a great amount of extra care and attention to rear successfully. A liberal supply of fresh-cut bone has a most excellent effect during this trying stage, assisting very materially in the formation of new feathers and strong, healthy frames. There are some excellent bone-cutters on the market, ones that crush the bones quickly, are comparatively easy to work, and by no means expensive. For the last few years I have added a few drops of Parrish's chemical food to the drinking water of the growing chickens, with the most excellent results, and I can thoroughly recommend this plan to all who find any difficulty in rearing. A few drops should be placed into a vessel, just sufficient to color the water faintly, and it is surprising what an excellent effect it has upon the development and health of the youngsters. Should the chickens be looking at all sickly or delicate, double the quantity may be supplied, which will speedily restore them to their wonted health and vigor.

After the Hay is Cut.

It often happens on a farm that space is at a premium during the few weeks preceding haymaking, and thus it may be necessary to confine somewhat closely both the adult and young stock. As soon as the grass is cut, however, there is plenty of meadow land available, and it should be taken advantage of to the fullest extent. Portable houses should be employed, and they should be scattered far and wide about the fields. This is beneficial for several reasons. In the first place, the birds are undoubtedly better for the change from comparative confinement to full liberty. They are obtaining exercise all day long, and there is nothing which maintains health so well as plenty of exercise. Then, too, there is a saving in the food bill, since the birds enjoying a free range are liable to secure so much natural food for themselves—the very best kind they possibly can have. On many occasions I have kept a flock of birds for several weeks without supplying them with any food whatever, at the end of which time they have been in equally good condition as birds which had been confined and given two meals a day. And, lastly, there is the benefit the land derives from the presence of fowls. The dung is a highly concentrated fertilizer, and it is quite surprising what an excellent effect it has upon the herbage. Fowls have the effect of encouraging the finer grasses, and they quickly improve the herbage very considerably.

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

The Banwell Hoxie Wire Fence Co., Ltd.
Dept. K Winnipeg, Man. Hamilton, Ont.

Poultry Appliances.

Now is a good time to overhaul thoroughly all the appliance, and to repair those which need repairing, and replace those which are worn out and beyond renovation. "A stitch in time saves nine" should never be forgotten, and very often half an hour's work may lengthen the life of a coop, brooder or house by several years. During wet weather, too, as much of the painting and tarring as possible should be done, as it dries quicker, besides which the wood is in a better condition to tave it readily.

Dying in the Shell.

Dr. F. G. Hall, of No. Adams, Mass., writing to American Poultry Advocate on this subject says:

My father always raised chickens. He raises them today, at 73 years old. He taught me to raise them. He was very practical in his methods We always used hens in hatching. Many times did we find chicks unable to get out of the shell at the end of 21 days (and we always used warm water a few days before the hatch came off, to soften the shells. This was done by sprinkling them carefully.)

I asked him why sprinkling should be the means of getting the chicks out. He gave me a reason which I have always thought correct, viz: The membrane too tough. This is caused by the shells being too hard or too tough.

Now, if a hen could not hatch them out, would it be possible for an incubator to do better, conditions being same with both?

I am simply suggesting my idea of this much abused question. I have been reading and am taking several poultry papers. I study them well. They are, on the whole, great and good, but they are filled too much with the lack of practical knowledge.

To reiterate: The membraneous sac which surrounds the chicks inside the shell is too tough, lacking in something, or the egg shell itself is tough. This becomes so, of course, by same reason. I believe it is the lack of something in the make-up of the egg shell itself—they vary greatly.

You

will like the fine flavor of Red Rose Tea. It has the cup goodness that comes only from Red Rose quality—the reason why it holds first place in thousands of Canadian homes. Will you try it.

Love's Barrier

(Continued from last issue)

CHAPTER V.

CYNTHIA.

The red glow from the log fire and the subdued radiance which stole in through the curtains of yellow silk mingled harmoniously in the pretty, old-fashioned room, and shut out the bleak greyness of the winter afternoon. A faint swish of silk skirts, a whiff of perfume, followed the opening of the door about four o'clock, and Mrs. Revell, fresh from her afternoon nap, glided in. She was a small creature, delicately fashioned, her long trailing skirts of black giving her a fictitious height. She glanced critically round the room, moved a flower vase here and there, shook up a cushion, and then moving to the fireplace rested the toe of her dainty shoe on the polished steel of the fender, and gazed abstractedly for a second or two into the fire. Standing there in the half-light, with the shadows behind her, she looked a remarkably pretty woman, and ridiculously young. The apology for a widow's cap, just touching with light coquettishness the gold of her hair, seemed an absurdity. But it was immensely becoming. For no other reason did Cynthia Revell cling to it in the third year of her widowhood. The first impression of her face was that of extreme girlishness and a kind of pathetic appeal. But a closer study quickly revealed the hard lines, especially the tell-tale ones about the mouth. It was not a pretty mouth; the lips were too thin, and were apt to compress themselves so firmly as to give the impression of shrewishness and bad temper. One by one these tell-tale lines are drawn on the human face, and we cannot gainsay their significance, even if we would.

The clock struck four; the hands moved again, and presently it was five minutes—ten minutes—past, and her eyes became a little anxious and strained. Did some expected good tarry sadly, some wished-for interruption fail to come? At a quarter-past she put out her hand with a little gesture of impatience, and rang the bell, which was answered promptly enough by the neat page-boy who had answered Secretan at the door.

"Bates, you may bring up tea precisely at half-past, and I am not at home this afternoon to anyone except Mr. Harold Lascelles."

"Very well, ma'am," replied the cheerful Bates, and was about to go when his mistress spoke again.

"Where is Miss Helen—do you know?"

"No, ma'am, I don't. She went out just after two, and ain't been back. I was a-wonderin' meself, becos of a gentleman wot called soon arter two, and was to come back at tea-time."

"A geneleman, Bates! What kind of a gentleman?"

"Clergyman, ma'am, by his clothes."

"Mr. Paget or Canon Rawnsley?"

"Oh, no, ma'am, none o' them. This was a very big, good-lookin' gentleman, wot wos very anxious to see Miss Helen."

Bates added this on his own account. He was not without imagination, and some small sense of humor. Absolutely devoted to Miss Helen, he yet managed to keep his place with a most exacting mistress. Cynthia was unaware that Bates was the bond-slave of Helen, and that he lived but to serve her. If she had for an instant suspected it, Bates would have had his dismissal forthwith. Cynthia was one of the women by no means uncommon, for whom the servant in the house does not exist, save as an instrument to minister to her need or her convenience. It is a common failing among those who have been raised from some rank akin to the creatures they despise.

"And did he say he would come back at half-past four?"

"Yus, ma'am."

"Well, she must see him in the dining-room or the morning-room, tell her. I am at home to no one except Mr. Lascelles. Did he give any name?"

"No, ma'am."

"Very well. You have my orders. See that you carry them out."

Bates retired obediently, to forward his preparations for tea.

Bates was a first-class servant, with thoughtfulness far beyond his years, and he owed his training entirely to Helen. She liked the boy from the first moment, when for economy's sake it had been decided to introduce him into the house, and she had taken no little pains to instruct him in his duties. Helen was very fastidious. She could not endure the second-rate or the squalid, without at least making some effort to improve upon it.

Bates could have tabulated the conditions of life in that quiet house with unerring precision. He knew just how it was between these two women, and appreciated every change in the atmosphere, while he appeared only a page-boy, a little overpowered by his manifold duties. And sometimes the small, loyal soul would retire to his pantry, shaking an indignant fist, and even on occasion dashing away a few passionate tears. He was a daily witness to the torture that can be inflicted on a noble nature by an ignoble one; and, being merely primitive man in the making, Bates' one solution was to wring the neck of the one, so that the other might be freed.

As he passed through the hall the bell was rung and a note hastily pushed thraugh the letter-box. Bates took it out. It was an envelope bearing a regimental stamp, and addressed to Mrs. Revell in a somewhat crude, unformed handwriting. Bates laid it on the salver, debated for a moment whether he should let her wait for it till he was ready to take up the tea-tray, but, remembering how Miss Helen had impressed upon him the necessity for delivering all messages without delay, he thought better of it, and carried the missive to the drawing-room. His mistress had started forward, and her color was fluttering sweetly all over her face, fully expecting the arrival of the tardy visitor. When she saw it was only Bates with a note, she bit her lip. She did not open it, however, until the lad had disappeared, closing the door behind him. It was a very brief note, and, as her eyes scanned it, her color rose to a fierce blaze, and her eyes seemed to emit sparks of fire.

"Dear Mrs. Revell," it began abruptly, "I've been thinking over our talk last night, and have decided that the only thing I can do is to leave Colchester. Happily I can do that by the intervention of my uncle, General Graves. I have heard from my people, and I leave to-day by the three fifteen. Thanks awfully for all your kindness to me. I have been a fool, I know, and I can only beg you to forgive and forget.—Yours faithfully,

"Harry Lascelles."

Cynthia crushed the letter in her small but strong fingers, and tossed it into the fire. Her breast was

MY DAUGHTER WAS CURED

By Lydia E. Pinkham's Vegetable Compound

Baltimore, Md.—"I send you herewith the picture of my fifteen year old daughter Alice, who was restored to health by Lydia E. Pinkham's Vegetable Compound. She was pale, with dark circles under her eyes, weak and irritable. Two different doctors treated her and called it Green Sickness, but she grew worse all the time. Lydia E. Pinkham's Vegetable Compound was recommended, and after taking three bottles she has regained her health, thanks to your medicine. I can recommend it for all female troubles."—Mrs. L. A. CORKRAN, 1103 Rutland Street, Baltimore, Md.

Hundreds of such letters from mothers expressing their gratitude for what Lydia E. Pinkham's Vegetable Compound has accomplished for them have been received by the Lydia E. Pinkham Medicine Company, Lynn, Mass.

Young Girls, Heed This Advice.

Girls who are troubled with painful or irregular periods, backache, headache, dragging-down sensations, fainting spells or indigestion, should take immediate action and be restored to health by Lydia E. Pinkham's Vegetable Compound. Thousands have been restored to health by its use.

Write to Mrs. Pinkham, Lynn, Mass., for advice, free.

HAS USED

DR. FOWLER'S Extract of Wild Strawberry

For The Last Fifteen Years

Mrs. Duncan McRae, 62, 6th St. North, Brandon, Man., writes:—"It is much pleasure for me to say that I have used Dr. Fowler's Extract of Wild Strawberry in my home, every Summer, for the last fifteen years.

"I have six children and have used it on every one of them.

"I use it myself and so does my husband. Last summer my baby, seven months old, was taken very sick with Summer Complaint, and we thought he would die. We got a bottle of Dr. Fowler's Extract of Wild Strawberry and started giving it to him in small doses and in three days he got quite well, so we kept on with the medicine for about a week or more and he became as well as ever.

"My little girl, two years old, was taken very bad with the same trouble, and I used two doses of the same medicine and she was completely cured.

"Myself and my husband think there is no other medicine so good for all bowel complaints.

"If anyone wishes to know what an excellent remedy Dr. Fowler's Extract of Wild Strawberry is, I am willing to tell them what it has done for me."

Spring Cleaning

is considered a necessity by everyone and ye they fail to eradicate from their blood the accumulated impurities, whose presence is indicated by listlessness and loss of energy and by the occurrence of canker and pimples. If these impurities are left in the body it is in a suitable condition to fall a prey to tuberculosis and other diseases

For this purpose thousands of people take 2 bottles of

GATES' LIFE OF MAN BITTERS

And 1 of Gates' Invigorating Syrup every Spring

These increase the activities of the organs which remove wastes from the blood, and thus the system is fortified to withstand the summer exertions.

Sold everywhere at 50c per bottle

AND BY **C. GATES & SON,**

MIDDLETON, NOVA SCOTIA.

heaving with a very real passion, for, apart from the prospect her latest love- affair with the grandson and heir to an earldom had offered, she had liked the young subaltern for himself. It was a cruel blow, and destroyed at one fell swoop the whole fabric of an ambition which had seemed to reach the stars. By means of Harry Lascelles she had hoped and intended to climb far above her compeers leaving all the sordid make shifts of her widowhood behind. And it was allover! The boy whom she had experted to offer her a serious proposal that very afternoon had escaped like a bird fram the snare of the fowler.

Cynthia's expression was not very pretty as she paced the room, wrestling with her stupendous disappointment. It was one humiliation the more, because the affair was already the talk of the town, and Lascelles' sudden disappearance would be readily understood. Bates understood presently when he appeared with the tea tray that his mistress had not been pleased with the communication he had brought. She did not speak to him, and did not even appear to notice his entrance, but he knew the signs. He spread the tea-cloth very deftly, and silently set out the cups, put the muffin-dish on the fender, and immediately withdrew.

Cynthia continued her restless walk apparently oblivious of the fact that her tea, of which she was very fond, was waiting on the table. In about ten minutes' time she seemed to observe it, and stopped by the table to put a lump of sugar in her cup. Observing that second cup which Bates had discreetly provided, when told that his mistress would only be at home to Mr. Lascelles, she raised it in a sudden fury, and crashed it into the fireplace, heedless of the fact that it was one of a very old and valuable set which belonged to Helen. As the slender things crashed in the fireplace, the door suddenly opened, and two persons entered—Helen and a tall stranger in clergyman's dress.

"I told Bates I was not at home this afternoon, Helen," she said icily, though her face was still crimson with the fury of her passion. "You must take this—this gentleman to the morning-room, or the dining-room, where they can bring you tea if you tell them."

"He has come to see you, Mrs. Revell," replied Helen quite calmly. "May I introduce Mr. Secretan?"

There was something unusual in Helen's look and tone, and, naturally curious, Cynthia took a second glance at the man, and was immediately struck by his handsome looks.

"Who is Mr. Secretan?" she inquired, with a slight, supercilious uplifting of her brows. Helen flushed at the rudeness of the question, and sent an appealing glance at Secretan's immovable face.

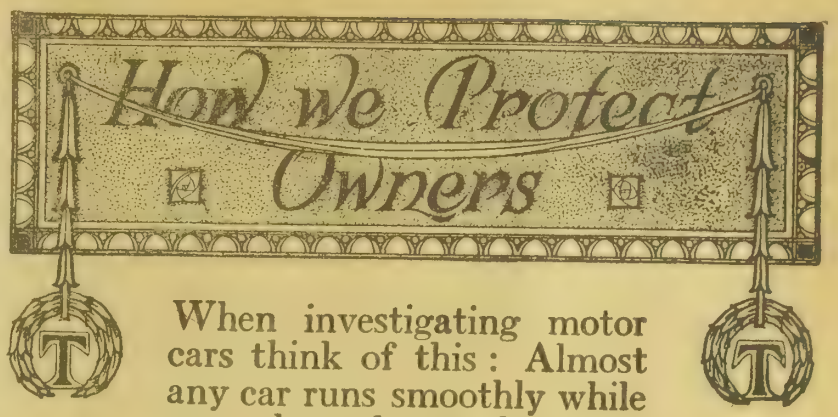
"If you will excuse me," she said to him nervously, "I will leave you to explain."

"Most certainly; it will be better," he replied courteously, and, walking to the door with her, waited to close it after her.

Her curiosity still further piqued, and in no way averse to being left with the handsome stranger, Cynthia put down her cup and slightly smiled.

"I don't know who you are Mr. Secretan. My stepdaughter is a most extraordinary person. If you know her well, I dare say you have found that out already.

Secretan did not smile in response. He came up the room conscious of being in a somewhat awkward position, and only concernWed to get out of it as quickly as possible. He was surprised at the appearance of her sweet looks. It was hard to be-Mrs. Revell, at her extreme youth, lieve that something very different



When investigating motor cars think of this: Almost any car runs smoothly while new, but the racking of motor operation, and road-vibration, soon tends to disarrange the delicate motor adjustments in cars of ordinary design.

Then ask yourself: What will this car be like after running a few months?

"Everitt" Design

protects owners by safety devices, self-oiling devices, and extra quality of material at every point subject to extra strain. The "Everitt" motor is made strain-proof and vibration-proof by being built in, on and around a solid one-piece casting that is perfectly rigid. All the delicate adjustments and moving parts have bearings immovably seated in this unvarying main unit. Therefore adjustments **remain** correct and the motor runs smoothly, always.

More: "Tudhope Service after you buy" is an asset worth a considerable share of the cost of your "Everitt." This is **protection** to the owner.

was to be found within.

"I am aware that this is an intrusion," he began, with a singular abruptness which he could not avoid in the circumstances. " I understand that Mrs. Revell has not told you of our meeting in Paris."

"Oh, no; Helen is very close. I know nothing of her movements. You met in Paris, then? Where, may I ask?"

"Only in the Luxembourg Gardens a few times, madam; but some friendships advance rapidly, and I am here today to tell you that I have asked Miss Revell to be my wife, and that she has accepted me."

Mrs. Revell stared at him a full second with incredulous eyes, and then incontinently burst out laughing. Now Cynthia's laugh was one of the most attractive things about her, being wonderfully childlike, spontaneous and infectious. She put up the wisp of her lace handkerchief to her mouth at last, and murmured a word of apology.

"Pray excuse me, but I could not help it. It seemed such a ludicrous idea for Helen to steal out at lunch time after a most uncomfortable morning and return at tea-time with a finance. How did it happen? Pray sit down and tell me all about it. I am immensely interested. But won't you have some tea first?"

Secretan shook his head.

"There is nothing to tell," he said quite as abruptly as before, hating the idea of appearing ridiculous before this pink-and-white creature. "I have informed you of the fact. The only other item you need know is,that the day is fixed. We shall be married in four weeks from today."

"Heavens! and what happens after that? Where do you spring from? What are you going to keep her on? Who will give the wedding? It seems to me it would have been simpler had you run away together from Paris. I can't do anything to help you. Hevens knows there has been talk enough in this vile hole about the Revells. We don't want to give any more occasion."

Here the real woman slipped out. Vexation showed upon her face, the shrewish lines appeared about her mouth, and the pink-and-white prettiness was lost in the haggard lookoning of the woman of the world. Secretan was amazed at the change.

"There need not be any talk, nor any occasion, madam," he replied politely but coldly. "We shall be married in London without fuss, and no one except yourself need know that Helen has gone away. We have no wish to give you any trouble. Indeed, Helen assured me that it was wholly unnecessary to come and tell you, that you would not even be interested."

"Ah, that is just like Helen! She has always been close and unfriendly. I suppose she has concocted a frightful story of my wickedness to you, but I shall not seek to defend myself, I assure you. The stepmother is lawful game, and nobody ever gives her the smallest credit for an ounce of common decency or feeling. Since these are my views—yours and Helen's, of course—may I ask why you are here?"

"I am to blame, if there is any blame," answered Secretan, with the same stinging sense of the ludicrous hanging about him. "I conceived it to be merely courteous to see you before I left Colchesterf After all, this is Helen's home, and I wished to show some repsect towards it."

"It is a house, but it has never been a home," replied Cynthia, raising the lace trifle to her eyes. "I wish that I had never seen it. I was happy until I encountered the name of Revell. I was left with two hostages to fortune, no means, and a difficult step-daughter, who has misjudged my every action. You should stay in Colchester for a time, and inquire regarding the family. It might be worth your while," she added significantly.

"I shall not do that, madam," replied Secretan, now beginning to wish heartily that he had taken Helen's advice. "Perhaps you will permit me to wish you good afternoon now."

"Oh, don't be in a hurry. If you are going to enter the family, we may as well be friendly. You might find just one or two in the town who would put in a good word for the stepmother; and now you have told me so much, why not a little more? How often did you meet in Paris? Helen is a very cold person—that is, generally," she added as an afterthought. "I really can't conceive how you ever got so far in such a short time. Do enlighten me. Helen and I don't always agree, but really this is most interesting, and I've had a dull afternoon."

In spite of his feeling of awkardness Secretan could not forbear a smile. The queer side of things struck him, and certainly Helen had in no way prepared him for a woman like this. He had imagined every type but the right one.

"Ah, now you don't look half so severe," she said, leaning forward with a pretty air of confidence.

"Really I wish you would tell me more things. I assure you I am a very friendly person when people take me in the right way. Helen is rather difficult. It is just possible I might be able to help you a little. I am sure it would be my wish to do so, for I bear her no ill-will."

"I don't think anything will be gained for either of us to enter into a full discussion," said Secretan a trifle formally. "Perhaps it will be sufficient to tell you that I am in a fairly good position, and hope to get a better living soon. Certainly now I shall exert myself in that direction, and will do my utmost to make her happy."

"Will she make you happy?" inquired Cynthia, with a sudden droop of the eyelids. "After all, there is some little importance attached to that. My experience of men has taught me that they expect something, if not a good deal, in the life matrimonial."

Secretan rose to his feet, determined that he would not discuss Helen with this woman, who, with all her specious ways, her air of pretty deference, must be innately cruel and unreliable. Otherwise how could the hard, sad lines on Helen's face be accounted for, the awful bitterness of her utterances?

"I don't want to discuss anything beyond actual facts, Mrs. Revell, and these, I think, have been covered. I have been able to satisfy Helen regarding my position, and as she has accepted me that ends the matter, so far as I am concerned, and she has no legal guardian, it appears. So my responsibility is solely to her."

"I should like very much to know what Helen has told you," she said, clasping and unclasping her hands. "She is not so very young, of course, and there have been other affairs. Did she mention the last one? I am the sole representative of the family, and I have a duty to you."

"Helen has told me all that is necessary," said Secretan with an increasing coldness. There was a quiet virulence in Cynthia's eye which told that she eagerly sought opportunity to make mischief. He began to move towards the door.

"Must you really go? It is not very friendly. Let me ring for Helen, and have some fresh tea sent up. I assure you I feel nothing but interest in you two. It is really exciting, and a wedding in four weeks!"

"I won't wait today, thank you, Mrs. Revell. Good afternoon."

"Good afternoon, then, if you will go. Helen a parson's wife! I can't realize it quite! You must excuse me if I seem flippant, but it amuses me very much."

The echo of her mocking laughter sped him down the stairs.

Old Magazines.

In every house there is an accumulation of magazines at the end of two or three months, and in some homes these periodicals come in so fast that the housewife bundles them off to the attic or consigns them to the ash barrel simply to get them out of the way when each member of the household has finished reading them.

In many cases, and especially in the better class of magazines, there are articles, biographical, etc., which are well warth keeping, not to mention the really good novels which in many cases appear before being published in book form.

The lover of books and good reading will readily admit that it is a waste of good material to destroy these, since with a little pains they could be saved and a valuable collection of interesting articles be the result.

It is safe to say that there is scarcely a subject of interest to he people that is not dealt with in the modern magazine, and to those who have not the time to hunt up these subjects these magazine articles give an intelligent idea of what is going on about one.

And not the least of the features of interest are the illustrations.

It is pretty much of a bother to

Mid-Summer Agricultural Meetings.

The following list of meetings has been arranged by the New Brunswick Provincial Department of Agriculture, at the invitation of the various Agriculture Societies, at the various points mentioned.

It is proposed that at each place a field meeting shall be held in the afternoon where the subject of Soil Cultivation will be practically taken up and discussed, as well as lessons given in Live Stock Judging.

The ladies of the district will also meet during the afternoon when the lady delegates will give a demonstration and lead a discussion upon matters connected with Domestic Science It is understood that the Cooking of Meats will be one of the subjects taken up.

The following include some of the speakers who will attend the various meetings :

Messrs, Andrew Elliott, Galt, Ont.; Theodore Ross, Charlottetown, P. E I.; Seth Jones, Sussex, N B.; A. G. Turney, Provincial Horticulturist; Secretary for Agriculture and others.

The speakers and demonstrators on Domestic Science will be Miss Bessie Elliott, of Galt, Ont. and Mrs. A. E Dunbrack, of Fredericton, N. B.

In the evening a joint meeting will be held at which addresses will be given.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Harbour Works in Courtenay Bay, St. John, N. B.," will be received until 4.00 P. M., on Thursday, August 10th, 1911, for the construction of a Breakwater, Wharves, for the Dredging of a channel and basin, and for the Filling shown on plan and also for the Construction of a Dry Dock and Ship Repairing Plant of the First Class under "The Dry Docks Subsidies Act, 1910."

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; J. K. Scammell, Esq., District Engineer, St. John, N. B.; C. E. W. Dodwell, Esq., District Engineer, Halifax, N. S.; A. R. Decary, Esq., District Engineer, Post Office, Quebec; J. L Michand, Esq., District Engineer, Merchant's Bank Building, St. James St., Montreal, Que.; J G Sing, Esq., District Engineer, Confederation Life Building, Toronto, Ont.; H. J. Lamb, Esq., District Engineer, London, Ont.; and at the office of the High Commissioner for Canada, London, Eng.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, for the sum of five hundred thousand dollars ($500,000.00) which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be eturned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R, C. DESROCHERS,
Secretary.

keep a stack of old magazines, but it will be a source of pleasure to the person who has the desire if he will clip these and make a collection of scrap-books, divided into classes according to the kind of clipping pasted inside.

One book should be set aside for all the illustrations which are worth while and which in later years will give one an interesting glance at the style of art popular in an earlier day.

And not only will it be a pleasure but an economy as well to save the serial story, which in a month or two may be one of the year's best sellers at $1.45.

Each scrapbook may then be catalogued under its contents, and the result will be several volumes of the most interesting and instructive reading of the day in a condensed form.

"Empty Lives."

Did you ever think of an empty life and what it means? One who has every advantage and yet makes no use of them except for self.

I knew a lovely, beautiful young woman who from her girlhood was surrounded by all the wealth and the luxury of this world could give. She grew up the idol of society, every one loved her, she was a perfect beauty, she had wealth, a brilliant mind, an ideal home, a devoted husband, and was the centre of love and admiration of every circle in which she moved. A few years ago, after a life spent entirely for herself, she passed away, and the sentiments of even her most ardent admirers were 'A wasted life.' What could not such a woman have accomplished? And yet, her life was empty. Henry Van Dyke thus expresses his thoughts on empty lives: "Think of the result of existence in the man or woman who has lived chiefly to gratify the physical appetites—think of its real emptiness, its real repulsiveness, when old age comes and the senses are dulled and the roses have faded and the lamps at the banquet are smoking and expiring, and desire fails and all that remains is the fierce, insatiable, ugly craving for delights which had fled for evermore: think of the bitter burning vacancy of such an end, and you must see that pleasure is not a good haven to seek in the voyage of life!'

The New Gloves.

The smart French fancy which should reach here soon is the wearing of Gray suede gloves in the morning or with all informal costumes. These have one button on the wrist and are then turned wisely over the hand into a cuff which is lined with empire Green or Egyptian Braid. It is quite a fashion of the moment to have this cuff of the glove carry out the color scheme of the costume.

Babies Well Born and Well Bred

The most interesting article we have seen on the care of young babies is by Dr. Woods Hutchinson in Nash's Magazine for April. We give a few extracts from it to give an idea of its quality, but we advise anyone who is interested in the subject to get the article for himself, or herself. One of the greatest, if not the greatest, of all crimes is to bring into the world, or to permit to be brought into the world, a child unfit, diseased, defective, handicapped in any way for the race of life. No act which prevents this will ultimately stand as a crime in the conscience of the race. Two-thirds of our failures in every class of life, of our paupers and our criminals, are the offspring of parents

A Saving of $5.00 Each Year

I have found the cure.

I will mail, free of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness; kidney and bladder troubles where caused by weakness peculiar** to our sex.

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 WINDSOR, ONT.

who ought never to have been permitted to marry at all, or ought to have been divorced as soon as one found the other out! A healthy baby during his first half-month should scarcely make more noise than a potato, and should be treated like one; planted in a warm, sunny spot, watered well, and disturbed as little as possible. When he wants anything he will wake up and mention it, but only just loud enough for you to notice it, unless you are inattentive enough to require him to repeat his remark. But this will seldom happen if you are politely attentive to his first suggestion. A baby never cries just to expand its lungs or to hear himself.

FRESH AIR.

There is absolutely no danger of a baby's "catching cold" by the exposure of its face, or through its nose, unless the air that it has to breathe contains germs, gases or dust. Babies are exceedingly sensitive to foul or overheated air, not at all so to cool, fresh air. Keep the nursery windows open day and night, and if by so doing you make the room too cool to be comfortable for the fussy old nurse and the local busybody, so much the better. You cannot give a baby too much fresh air; if he has plenty of fuel under his boilers he will turn half of it into heat. After the first two weeks his daytime sleeps should be taken in the open air in some sheltered sunny spot, provided the temperature be not too low. Veils and face wraps of all sorts, save in the coldest weather, are an abomination, a relic of barbarism, and a mark of superstition, in infancy, as well as in later life. When asleep at any temperature above fifty degrees, one light, soft, fleecy blanket and one light coverlet made of linen filled with three or four sheets of surgeon's cotton—not the ordinary cotton wool of the shops—will be abundant for cover, with an additional coverlet in case of a cold night or wind.

BOTTLE-FEEDING DEATHS.

The appalling death-rate which occurs during the first year of life and which averages from fifteen to twenty per cent., draws three-fourths of its victims from the bottle-fed one-fourth! In other words, the death-rate among bottle-fed children the world over is three times as great as among those breast-fed. In the parish of St. Pancras, London, for instance, of the 770 children dying under one year of age in 1905 the proportion of the breast-fed was twenty-four per thousand, and of the hand-fed ninety-two per thousand, nearly four times as great. Dr. Robertson found in Birmingham, over thirty times as many hand-fed babies dying

THE LOCK
MARITIME WIRE FENCE
CAN'T SLIP
The illustration demonstrates the phenomenal gripping-strength of our lock. Under the most unusual strain it never gives. It is known as the lock that can't slip; the lock that unfailingly holds the wires in their correct position.

A Strong, Stay-Tight Connection Where Other Mowers are Weak

Seventy years' experience, plus a disposition to use the very best materials when it might seem more profitable to cheapen things, is why Frost & Wood Implements excel from the "Quality" standpoint.

Take, for instance, the connection between the Cutter Bar and Main Frame of a Mower. Others use Small Pins, that wear quickly, thereby allowing connection to work loose, and eventually "bang" the machine into a blacksmith shop. We use "large" Bearings for our "stay-tight" connection (see illustration). They fit accurately and there is no opportunity for wear, because Cutter Bar has no chance to work loose from Main Frame. No time lost on the field—no bills to foot.

Another example of Frost & Wood "Quality" is the Pitman Connection of Forged Steel and "the Ball and Socket Joint"—strongest, firmest connection on the market.

Roller Bearings, with heavy boxes to maintain them in perfect position, make the No. 8 run easier than others. Every connection is neat and accurate. The "Internal Gear" cuts out the necessity of a "flying start"—knives commence cutting with first forward step of horses.

The No. 8 Mower and its companion, the Tiger Rake, are on the top-most rung of the "Quality" ladder.

FROST & WOOD No. 8 MOWER

THE FROST & WOOD CO., Limited
Smith's Falls, Canada

as breast-fed. In Hudderfield it is stated that before the age of three months, fifteen hand-fed babies die to one breast-fed.

The reason the modern mother does not nourish her own child is that for various causes she finds it inconvenient to do so, not because she has lost the power. First and foremost among these reasons for disinclination is the lamentable delusion that babies can be raised "just as well" on cows' milk, or some modification of it. When this false premise has once been accepted any trifling matter—convenience, indisposition, pressure of other engagements, aesthetic considerations, and, last but most powerful of all, a singular sense of false modesty, a notion that by carrying out of the function is something to be ashamed of—is sufficient to turn the balance in favor of the bottle. The amount of protein, or "meat" in cows' milk is double that in human milk, and the proportion of it which is in the form of tough, indigestible casein is nearly six times as great. This is why it makes such a tough, hard, indigestible curd in the unfortunate baby's stomach which is not in the least fitted to digest it. No amount of dilution, or modification, will overcome this radical defect. Incidentally, the amount of sugar in cows' milk is only half that required by a baby, so that as you get the protein right by diluting you get the sugar wrong, but this can be remedied by adding milk-sugar. Every single ingredient of cows' milk is wrong for the baby's stomach—its protein is bovine protein, its fat is bovine fat, its salts are of the kind and in the proportions required for a calf instead of a baby. What the delicate stomach of the baby needs and is "geared for" is human protein, human fat, and humanized sugar and salts.

FLORICULTURE

A. S., Digby, N. S., writes:— My rose bushes are covered with little green slugs or worms that are eating the top off the leaves, leaving only the skeleton of the leaf. What should I do for them?

Ans.—The rose slug is very destructive and German hellebore should be applied at once, one spoonful to one gallon of water, put on with a sprinkler while the foliage is dry. Two or three applications during the summer should be sufficient. Apply as soon as you see the first worm. Do not let them get a start.

Reader, St. John, sends a leaf of a plant for identification.

It is the Zennia.

Another writer says, "Could I save Stock seeds from the pods of the single Stocks, and if so when should they be gathered; also from Pansies?"

Ans.—We have never succeeded in getting seed from single Stocks that was any good. This flower requires to be hand fertilized and that should be done under glass. Pansy seeds are easily saved. Watch the seed pods and when they turn up the seed is good even if they look green. If the pods turn up the seeds will grow.

A. B., Moncton, N. B., writes,—I would like a little advice about my garden. There is a tall plant, like sample, that is very attractive to cats, which cause me a great deal of trouble; what is the name of it? The dandelions keep growing up in the gravel walks, what can I use to destroy them without killing the grass? How much gravel should there be on paths to prevent the growth of these pests? What is the best time to plant a Lilac hedge? When should Carnation plants be potted for winter blooming?

Ans.—The plant that the cats are so fond of is the Garden Heliotrope. It is hard to grow this plant in a city on this account, and if much damage to other plants is experienced it had better be dispensed with.

You can sow salt thickly on your walks to destroy weeds, if you can keep it from the sod and from affecting roots of adjacent trees through leakage. Before applying the tops of the dandelions should be cut off at the surface of the soil.

If you have five inches of gravel on your walks you should not be bothered with weeds. It is not worth while using less than four inches on garden walks.

Plant Lilac hedge in October.

In regard to the potting of Carnations for winter flowering, if plants are growing in the garden, about the tenth of September is a good time to pot up.

$3,600 in Cash Prizes for Farmers

ARE you going to build that new horseblock, sidewalk or dairy house of cement? Then insist on your dealer supplying you with the "CANADA" Cement. Not only will this ensure your getting a pure, uniform and strictly high-grade cement, that will guarantee the lifelong permanency of the thing you build, but it will also entitle you to enter our Prize Contest. And in this contest you stand a good chance of winning a prize that will perhaps more than pay you for the cost of the work. Every farmer in Canada who uses "CANADA" Cement is eligible to compete. Four prizes will be awarded in each Province and these prizes will be divided as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement.

PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement on his farm in 1911 for the greatest number of purposes.

PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement.

PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description, of how any particular piece of work shown by photograph sent in, was done.

Notice how we have purposely planned and imposed certain necessary conditions in order to give large and small users of cement an equal opportunity.

As an illustration of this: In prizes "C" and "D," the quantity of cement used has no bearing whatever on the result. The farmer who sends us the best photograph of as small a thing as a watering trough or a gate post, has as much chance for prize "C" as a man who sends a photograph of a house—and the same applies to prize "D."

Don't hold back from entering because you think you don't know anything about concrete work. It's very simple. Besides, we have a 160-page book that we will send you free on request, which tells you all about concrete and how to make and use it. In this book, you'll find complete instructions for the making of almost everything you can think of in the way of farm utilities, floors, vats, troughs, stairs, posts, etc.

This free book—entitled "What the Farmer Can Do With Concrete"—will not only inform you—it will also greatly interest you. So send for it anyway, whether you intend to try for one of the prizes or not.

The Canada Cement Company, Limited, Montreal, Que.

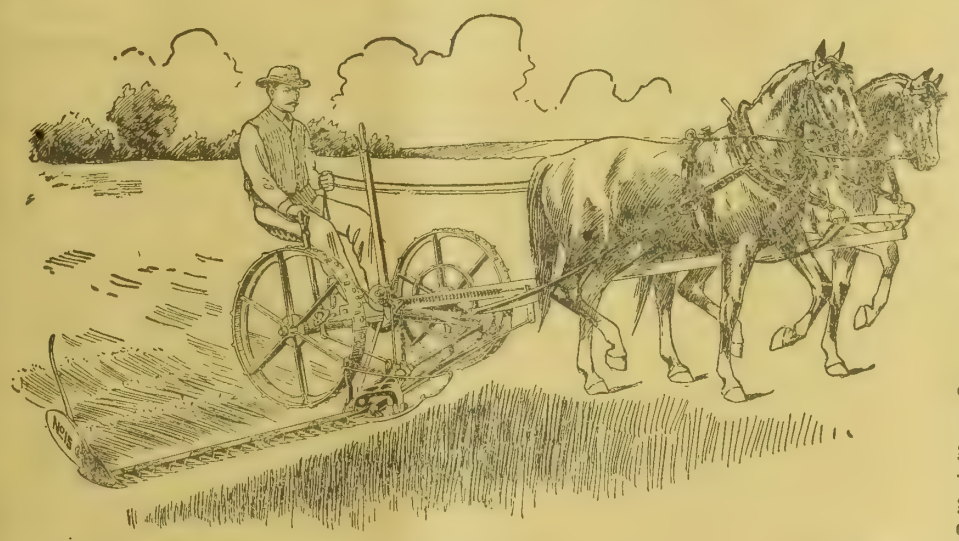
Massey-Harris Mower.



Large, broad-faced Drive Wheels.

Four-powl Ratchets—no lost motion.

Finger Bar and Knife back are finest rolled steel.

Long wearing Plates on cutter bar.

Steel Clips hold knife in position.

Sections have hard edge and soft centre.

Raised Ledger Plates give long cutting edges—the serrated edges add greatly to the cutting efficiency.

THE MASSEY-HARRIS CO., Limited, Moncton, N. B.

Swelling of Udder.

Is there any help or remedy for a swelling of one-quarter of cow's bag, and bad milk, when there is any, coming from that quarter) What is the cause of such condition in apparent healthy cows?—C. E. Taylor, Springfield, Me.

Inflammation of the udder, or mammitis, is probably the cause of this condition. It is a dangerous disease in the dairy, not because it is likely to cause the loss of the cow, but because it will seriously impair the cow's usefulness.

There are various causes for such a disease as this. It should be remembered that when a cow is in full milk, which is the time when such troubles comes on, the udder is a very sensitive portion of the animal mechanism, perhaps the most sensitive portion of the entire cow, and any condition which will affect the health, such as exposure to cold or sudden changes, injuries, indigestion, overfeeding with cottonseed, insufficient milking, is very likely to affect the udder.

In simple congestion or garget, the sucking calf is a great help in getting rid of this condition, but rubbing with the hand, using camphorated oil or hot lard, and thorough and careful milking will gengerally do the work, before the trouble is too thoroughly seated.

It would hardly seem possible for a cow to have this trouble to a very serious extent, or to have it recur frequently without some evidences that the health of the animal had been affected. The condition may exist, however, and occasionally does exist, with little or no fever. The longer the udder remains in this condition, of course the greater probability that it may not be restored to a healthy condition, and there is always danger of induration, or permanent hardening. Cows which are allowed to get into this condition develops abscesses and gangerene. The progress of the disease is more or less uncertain. Sometimes the bag will soften up and the flow of milk will return without much treatment. If there is little or no fever, the rubbing with camphorated oil or an iodine ointment and frequent and gentle milking, perhaps using a teat tube or teat dilator. If the swelling and stoppage of the milk is well seated, it is usually difficult to restore normal condition and action. The mechanical means are believed to be about the best. The use of an antiseptic injection of iodoform. in water has been recommended. Fomentation with warm, or hot water is also good. When fever is present, additional means must be used to allay that trouble.

We note that the inquirer speaks of this condition in "cows", using the plural. If this indicates that the disease is present in more than one cow in a herd, we should have some fear that there was present contagious inflammation of the udder, or contagious mammitis. The curative treatment cannot be much different than in simple inflammation. Prevention by thorough isolation and the use of antiseptics for complete and continued disinfection are to be strongly recommended, in order that there shall be no more infection.—

Cows Losing Milk.

T. M., P. E. I.—Please find enclosed 80 cents for one year's subscription to the Maritime Farmer. I find it a vefy valuable paper and would not be without it. I have a valuable cow, which is a good milker but she loses her milk. She is farrow this summer but still she loses her milk in all four teats Is there any remedy for it? If there is not I will have to beef her.

Ans.—The best remedy is frequent milking, three times a day or oftener if necessary. Wax or an adhesive may be applied over the opening in the end of the teat after each milking, but it gives considerable trouble as it has to be removed by soaking with warm water before each milking and another dose applied after milking. It is difficult to induce contraction of the muscles surrounding the opening at the end of the teat after it has become relaxed. When the cow is dry it would be well to bathe the teats daily with cold water to strengthen the muscle and if the teats become much distended before she calves, milk as often as necessary to prevent leaking and continue same afterwards.—J. Standish, Vf S.

King Devil.

M. C. Anderson, Albert Co., N. B. —I am sending you a sample of weeds for identification and advise re eradication. I noticed it first about three years ago. There was only a very little of it in evidence at that time in a grass lot that was cutting about two tons per acre. Now, this field is completely infested with the weed and it is rapidly spreading to other parts of the farm. What is the name of the weed and how can I rid my land of it? I consider it a very bad weed.

Ans.—The weed in question is the "King Devil" (Hieracium praealtum Gochnat var decipiens Koch), a perennial, introduced from Europe. It bears few leaves, nearly all at the base, and numerous leafy branches running on the surface of the ground. The whole plant is sparsely hairy and lightly covered with a fine bloom. Basal leaves narrow, the long flower stalk bristly hairy, supporting a spreading flower cluster. It is propagated by runners and seeds which are distributed by the wind. It occurs in the eastern provinces, particularly in south western New Brunswick, where it is a pest in pasture lands and old meadows. It is a pernicious weed in pastures as it is avoided by stock on account of its pugent flavor and hairy nature. When present in any quantity it entails much waste of forage or fodder.

Grass lands infested with "King Devil" should be brought under cultivation and a short rotation of crops. It does not long give serious trouble in a field under a rotation of crops that require frequent plowing. Infested meadows and pastures must be broken up and put under a short rotation of crops. For mountain pastures and uplands where plowing is not practicable, small patches may be kept from spreading by applying salt in hot dry weather, at the rate of 18 or 20 pounds to the square rod.

To Dry Cow.

Experience has shown that the best way of drying off cows, as it is

Farm For Sale.

A Money-Maker with Rare Attractions

90 acres; on electric line, borders charming lake, famous as select summer resort; 40 acres woodland, 1,000 cds. hard wood, 100,000 ft. timber in market will pay for all; balance in rich machine-worked fields and juicy pasture; fine orchard 200 apple trees in full bearing; aged owner retiring to smaller place, will include $100 motor boat, horses, cows, hogs, poultry, machinery and full equipment; price only $6,000, part cash; for picture of 13-room house, large modern barn, all details, travelling instructions, etc., see page 8, which also describes a beautiful lake farm of 70 acres for only $2,300, "Strout's Mammoth Farm Catalogue No. 34," copy free.—E. A. STROUT, Kent's Hill, Maine.

Quit Doing This → Get a GOOD Spreader

EVERYONE knows that if soil is not fertilized it will soon wear out. The barren condition of thousands of farms in this country proves this statement. A large percentage of this number could be improved if manure were spread judiciously.

Field experiments prove that eight tons of manure evenly spread are as good as twice that number spread in a haphazard way. Hand spreading requires at least twenty loads to cover an acre. With a manure spreader, eight loads will cover the same amount of ground more evenly, but—

Your problem of soil fertility is only half solved when you decide to get a manure spreader. The other half—of equal importance—is in deciding just which spreader is best for you to buy.

If you investigate thoroughly and decide carefully, you will select a spreader that thousands of other progressive farmers are having great success with—one of the

I H C Manure Spreaders

The simple design and unusual strength of all working parts of I H C Spreaders account for their long life and light draft.

The method of transmitting power from the wheels to the beater is simple and direct. There are no unnecessary parts to wear. The beater is large in diameter and the teeth are long, square, and chisel pointed. By using this style of tooth, the manure is thoroughly pulverized and is thrown out before it wedges against the bars. By using a square tooth, rimming of the bars is overcome.

I H C Service Bureau

The Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problem to the I H C Service Bureau.

The apron is supported by steel rollers and the slats are placed close together, so that manure does not sift down and interfere with the movement of the rollers. The steel wheels have ample strength to carry many times the weight they will ever be called upon to bear. The rims are flanged inwardly to prevent cutting and rutting of meadows and accumulation of trash. Z-shaped lugs give the wheel a practically continuous ground-bearing surface and do not jar the machine to pieces. There is no reach to prevent short turning.

In the I H C line, you have choice of these two famous styles—

Cloverleaf **Corn King**

All are simple, strong, and durable—all are easily and instantly adjustable to spread light or heavy, as the soil requires, and all three are made in sizes suitable to any size farm. See the I H C local agent—and get catalogues from him, or, write nearest branch house.

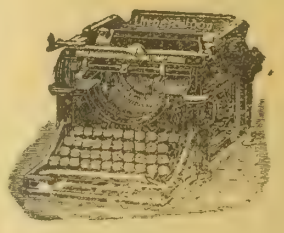
Why Every Breeder should Have a Typewriter.



After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

United Typewriter Co., Ltd..

Prince William St., - St. John, N. B.

called, is for the time to feed only dry foods, if on feed, and to do irregular milking, then milking but once a day, and during the week only alternate days. This will soon turn cows dry entirely. Some cows require more attention than others, and one should be careful to adjust the intervals at milking to the condition of the udder, as it takes longer to dry off some cows than others. If this is not effective try putting in her drinking water a little good cider vinegar—one-half cupful to 14-qt. pail of water. Alder bark steeped, and the liquid mixed with the drinking water is very effective to stop milk flow with mares, but have never been obliged to resort to it for cows. By all means, do not turn cow out where she can get grass and all the water she desires, until she is perfectly dry.

The Farmers Could Get Profit on Wool by Careful Grading.

Edittor Maritime Farmer:

Doubtless you have a large number of readers who will be interested in the enclosed clipping, which is copied verbatim from page 136 of the May number of the Canadian Textile Journal. These remarks on condition are very timely, as the farmers are about marketing their wool clip, and there is a tendency in the Maritime Provinces, as well as elsewhere, to neglect condition.

We trust that you will consider the clipping, or at least the last two paragraphs of it, of sufficient interest to your readers to copy in your paper.—John Kimble & Son, St. John, N. B.

"Wool is the farmer's product, the growing of which does not receive its due share of encouragement and protection at the hands of the Canadian Government in the shape of a tariff which would make for the development of a great woolen and worsted industry such as has been created under that condition in the neighboring republic. But that is no reason why our farmers should not do the best possible with this important product, even under such circumstances as do exist. More profit might be obtained by the farmer from his wool if he would be more careful in the manner in which he sends it to market.

Proper classifying, condition and cleanliness are factors which save annoying work to the buyers, and when properly looked after in the first instance, bring not only readier saleability, but a premium in price. Even in Australia where the growers may be supposed to be past masters in all the arts pertaining to placing their wool on the market, complaints are made as to carelessness in grading and conditioning. A writer in the Sydney, N. S. W., Stock and Station Journal, gives some instances in illustration of these points. Apart from the fact that it is necessary to separate entirely from each other the different types or styles of wool that are used in each branch of the manufacturing industry, the greatest factor in the price per pound is paid for wool, is condition. By condition is meant the yolk or grease which all wool contains in a greater or less degree, together with more or less sand or earth. One of the greatest faults in present day classing is neglect or ignorance of the all-important point, which will pay handsomely in results for any time and attention devoted to mas-it.

"Suppose a particular lot of wool catches the buyer's attention, and as he believes it will just fill his requirements, he is prepared to give even an edtra cent per pound. On further examination however, and probing deeper into the bales he finds a fleece which, though it may be be gaod in quality and staple, is lacking in condition, compared with those he first saw. He had to revise his estimate of the probable yield and true value of the lot, with the result that he makes his offer nearer to the basis of the poorer stuff. If the lot has been classed properly, the seller would have received a high price for the really good fleeces and a moderate price for the others, instead of which he has to sell the whole at the valuation of the latter. Just in the same way, the apple grower who packs Nos. 1 and 2 together, receives a No. 2 price."

EXCURSIONS TO WESTERN CANADA.

The Grand Trunk Railway System announce that on Tuesday; June 13th and 27th, July 11th and 25th, August 8th and 22nd, September 5th and 19th, 1911, Homeseekers' Excursions will be run from all Stations in Ontario and Quebec to Western Canada, via Chicago and Duluth or via Chicago, St. Paul and Minneapolis, at reduced round trip fares.

The well-known double track line of the Grand Trunk from the East of Chicago appeals to the traveller, and with the superior train service that is offered by this line, including the famous "International Limited" from Montreal daily at 9.00 a. m., and which is the finest and fastest train in Canada, many passengers will be attracted this way. The route via Chicago is a most interesting one, taking passengers through the principal cities and towns in Canada and in the States of Michigan and Indiana. In addition to this a choice of seven lines between Chicago and St. Paul and Minneapolis is offered.

Owing to the great number of Canadians who reside in Chicago, St. Paul, Minneapolis, Duluth and other cities en route, there is no doubt that the Grand Trunk will find many patrons who will take advantage of the opportunity thus afforded them for a brief visit at the stations with their friends.

Canadian citizens are exempt from so-called Immigration Examination, and there is no detention at any point.

Baggage is carried through the United States in bond without requiring any special attention on the part of the passenger. Inspection is not necessary at any of the points at the Border.

Another feature that will appeal to the homeseeker is the comfortable transfer at points like Chicago, St. Paul and Duluth into freshly ventilated clean cars, avoiding the necessity of travelling a long distance in the same car.

In addition to the above routes, the sale of tickets is also authorized via Sarnia, and the Northern Navigation Company's magnificent Steamers across Lake Huron and Lake Superior.

For further particulars apply to any Agent of the Grand Trunk Railway System, or write to Mr. J. Quinlan, District Passenger Agent, Bonaventure Station, Montreal, or Mr. A. E. Duff, District Passenger Agent, Union Station, Toronto.

How to Preserve Eggs.

There is no better method of preserving eggs than in water-glass, or soluble silicate of soda, which is not an expensive material to buy, as a pound, which only costs a very few pence, dissolved in the correct proportion of water, will preserve a large number. The amount of water to be added depends upon the sample, but as full directions are usually sent with each tin, it is difficult to go wrong. The eggs are placed in a glazed vessel, and covered with the liquid, care being taken that all the eggs are submerged. When they are wanted for use, they should be gently lifted out of the liquid, wiped dry, and used as speedily as possible.

The oldest, but still a very excellent, method of preserving is by means of salt, lime and water. Four gallons of lime, one of salt, and twenty of water, should be mixed together, and when the water has taken into solution as much lime and salt as it is capable of doing, it should be allowed to settle, the clear liquid being used to pour over the eggs, which have previously been placed in a suitable vessel. This method has the disadvantage of making the shells rough and extremely brittle—so much so, in fact, that, as a rule, eggs that have been preserved in lime cannot be boiled, the shells cracking with the least touch. When eggs are to be preserved for only a very short time—for two or three months—dry salt answers admirably, but this is an unsuitable method for a longer period. If a new-laid egg be dipped into boiling water, it slightly coagulates the white, and so prevents the air getting to the contents. For home use this method is suitable, but it does not answer when the eggs are for market. Smearing with vaseline or butter keeps the contents fresh for a week or two, but it is not recommended when the eggs are to be retained for more than a month. Only perfectly fresh eggs should be preserved, and it is largely a waste of labor and money to attempt keeping eggs that are more than two or three days old when placed in the preservative. They should be allowed to settle twelve hours after being laid, but the sooner after this time they can be treated the better will they be when they are wanted for use. Dirty eggs do not preserve at all well, and if there is any dirt or dung on the shells they should be washed. A dirty egg has an injurious effect not only on its own contents, but on all those that come into contact therewith. As infertile eggs preserve better than those containing a germ, it is advisable when producing eggs with this end in view to keep the hens apart from the male birds.

IHC WAGONS HAVE STOOD THE TEST OF ALL LOADS AND ROADS FOR YEARS

THE real proof of the strength, durabilit , and value of I H C wagons is what they have done and are now doing for thousands of farmers throughout the Dominion. Light loads and heavy loads have been carried by I H C wagons, over good roads and bad roads, for so many years that there is hardly a farmer who is not familiar with the high quality that these names on wagons represent—

Petrolia Chatham

Either of these should be your choice if you want to be sure of lifetime service. The quality in both is the highest possible—the result of years of wagon-building experience, and the use of the best materials, shaped by skilled workmen operating with the finest manufacturing equipment.

Petrolia Wagons are constructed of the finest quality wood stock which is thoroughly seasoned by being air dried. The ironing is of the very best. The inspection of each part is most rigid. Petrolia Wagons must be made so that they will live up to the I H C standard of excellence or they are never sent out of the shops.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Be sure to call on the I H C local agent. Get a pamphlet. Let him show you one of these wagons. If you prefer, write for literature or any other information you want to the International Harvester Company of America at nearest branch house.

I H C Service Bureau

The bureau is a center, where the best ways of doing things on the farm, and data relating to its development, are collected and distributed free to everyone interested in agriculture. Every available source of information will be used in answering questions on all farm subjects. If the questions are sent to the I H C Service Bureau, they will receive prompt attention.

Electric-Light from Old Cells.

I took four old dry cells, that would not operate my gas-engine any more, out of the gas-engine battery-box, and placed them on a shelf in my cellar. I bought a four-candle-power Tungsten electric-bulb, and hung it at the foot of the cellar stairs. I then secured ten feet of double insulated wire and a small switch.

The switch I fastened to the door-case at the head of the stairs. I connected one end of the double wire to the switch and the other to the electric-bulb. Then, to properly connect this to the batteries, I cut one of those two wires, fastened one of the ends to the zinc post of the first cell and the other to the carbon of the fourth cell. The cells are arranged in series.

Now, when I wish to go down into the cellar, all I need do is to close the switch and I have plenty of light to go down and get anything I want and bring it up; open the switch and out goes the light, with no lamp or lantern to carry or bother with. It is lasting well and is cheap, because I can use old, discarded cells.

E. S. RICHARDSON. ■

How Tondestroy Charlock.

The season for charlock spraying is now approaching, and those farmers who have not yet tried the effect of the copper sulphate spray in ridding their crops of this troublesome pest are recommended to give the matter their early attention. Last year saw an extraordinary growth of charlock in the root fields; on all sides the brilliant yellow flowers of this luxuriant plant formed a golden mantle over many acres of promising roots. There were some farmers who thought to prevent the growth of the weed by mowing off the heads; but it is never possible to cut off the whole of the pods. Some will inevitably remain, and these will derive extra nourishment from the root, and will flourish apace. Without the slightest doubt, charlock spraying is a profitable operation. The initial cost often deters many a small farmer from adopting this method, yet this is but a poor excuse, for a perfectly satisfactory spraying machine can be purchased for about £6 10s.; and it only remains to provide a couple of horses and an ordinary dung-cart on which to fix the apparatus. The cost involved must, therefore, appear inconsiderable when viewed in the light of the benefits derived.

COPPER SULPHATE SOLUTION.

The most successful method yet discovered of killing charlock among roots is by spraying with a solution of copper sulphate. At first sight, it appears a simple matter to dissolve a certain quantity of this material in so many gallons of water, afterwards spraying the solution over the growing roots and charlock. But there is a little more in the question of charlock spraying than first meets the eye of the average farmer. It is doubtless owing to the careless preparation of the fluid, the use of impure or unsuitable material, or ill-chosen times of spraying, that so many unsuccessful results have been recorded. The purity of the copper sulphate used is perhaps the most important point of all. Some time ago the Board of Agriculture and Fisheries directed attention to the fact that many worthless, and even adulterated, samples of so-called sulphates of copper were being put up by chemists and others who supply farmers with this class of material. It is undoubtedly the best plan to deal direct with a thoroughly reputable firm; and one should have no difficulty in securing a genuine brand of copper sulphate, specially manufactured far charlock spraying. Such material is usually prepared in a special form, so that it is instantly soluble in cold water. One quotation that we have received from a well known firm is 24s. 9d. per 100 lb. bag of sulphate of copper, guaranteed 99 per cent. to 100 per cent. pure. It may be noted that the market price of this material is rather higher this year than last year. Ordinary powdered copper sulphate is generally sold by provincial chemists and guaranteed at 98 per cent. purity, but it is only slowly soluble in water; and with such material it is usually necessary to soak overnight or to use hot water. The lowest grade of sulphate of copper is known as agricultural bluestone, about 50 per cent. pure.

HOW TO PREPARE IT.

For spraying charlock the usual strength of dressing is 15 lbs. sulphate in 50 gallons of water to the acre, but a stronger or weaker solution may be used according to the stage of development and quantity of charlock. Under favorable conditions, a 3 per cent. solution and a smaller quantity (12 lb. sulphate in 40 gallons of water to the acre) may answer the purpose quite well. Clean, soft water is preferable for making the solution, and the vessels used in the process must be of wood. A paraffin cask, capable of holding a little more than forty gallons, should be filled up to within a few inches of the top. The sulphate of copper may then be weighed out, put into the water, and the contents of the cask stirred briskly for a few minutes with a stick until the sulphate has dissolved. When the solution is ready for use, it should be strained into the sprayer, so as to avoid choking the nozzle. If several of these paraffin casks can be procured, they may be set up at convenient distances along the headland, and by keeping two or three barrels ahead of the sprayer no delay in the work need be experienced.

WHEN TO SPRAY CHARLOCK.

The proper time to spray charlock is when the weed is just commencing to bloom, and before it has had time to injure the roots. Some persons assert that it should not exceed three inches in height at the time of spraying, but usually the plant can be killed any time while it is blooming. A calm, still day should be chosen for the work, and never a dull day, if possible; the presence of sunshine contributes a great deal to the success of the operation. It is a mistake, however, to miss the proper time for spraying on account of unfavorable weather conditions unless the wind is very rough. If the crop is moderately damp at the time of spraying, the effect of the spray will not be diminished to any appreciable extent, but if rain falls within twenty-four hours the fluid will be washed off the leaves before it has had time to dry; and its poisonous effects will be set at nought. The immediate effect of the copper sulphate solution on the roots is that plants quickly recover and no permanent injury need be feared. Those who have not used the spray themselves, or have never had an opportunity of noting its effect upon charlock, will be rather astonished at the results. The charlock plants will appear brown and shrivelled, and in a few days they will drop down and be hidden from view by the green stronger growing roots. If further evidence of the efficiency of the spray is desired, some plots should be left unsprayed by covering them with a sheet or some old bags. There will be a well-defined contrast in the appearance between the sprayed and the unsprayed plots, and the farmer can best judge himself whether the good results, both in increased yields and cleaner land, more than compensates for the cost of the sprayer, materials, etc.

THE USE OF THE HARROW.

When the question of dealing with charlock is under consideration, the value of the flexible harrow ought not to be lost sight of. A good harrow used judiciously over the land when the young charlock seeds have germinated and the young shoots begin to appear will have the effect of breaking up and destroying large numbers of the plants, and without doing any damage to the root crop. There is no doubt that when the conditions are suitable and a really good harrow, such as the Parmiter, is made use of, such a method as this would go a long way towards clearing a field of weeds. The energetic farmer, if he is well advised, will make use of both methods. Later on in the season, of course, the harrow could be of little use, but employed just at the right moment it is most effective. Provided only that a portion of the growth of charlock is removed in the early stages in this way, the work done by the spraying

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education.
It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, Nova Scotia

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course begins NOVEMBER 1st, 1911.

Next Short Course for Farmers and Farmers' Sons begins JANUARY 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 2nd, 1912.

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmer's sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

later on would have a far better chance of completing its task. Some fields have an extremely thick growth of this pernicious weed, and it is in such cases that the early use of the harrow would prove particularly valuable.—Mark Lane Express.

Aid to Thoroughbred Stallions.

During recent years many appeals have been made to the Honourable Sydney Fisher, Minister of Agriculture, by horsemen anxious to bring about an improvement in the quality of our light horse stock and who are of the opinion that for this purpose an infusion of Thoroughbred blood is essential. Recognizing the force of these appeals as well as the importance of the subject, Mr. Fisher has decided to grant assistance under certain specified conditions to persons maintaining Thoroughbred stallions for service in the various provinces.

The lack in our light horses of the quality derivable only from the infusion of Thoroughbred blood is the subject of adverse comment by all European horsemen who visit the Dominion with a view to investigating its possibilities as a field for the purchase of horses whether for military purposes or for ordinary saddle or harness use. In this connection it should be remembered that while horses for the last named, or in fact, for any of these purposes, may well be bred from sires other than thoroughbreds, it is of importance that on the side of the dam there should, in order to produce the best results, be, in such cases, a strong admixture of Thoroughbred blood.

The conditions under which assistance will be given are as follows:—

(1). All horses on account of which aid is given by the Department must be registered in the Thoroughbred Stud Book of the Canadian National Live Stock Records.

(2) Horses shall be of good size, quality and conformation and shall be free from all hereditary unsoundness; these conditions to be ensured by submission annually to a thorough careful examination either at the hands of the Veterinary Director General or such other persons as the Minister may from time to time appoint for this purpose.

(3) Horses so approved shall be duly and properly advertised to stand for service of mares, under the ordinary and general conditions usual in the districts in which they are to be kept, at an annual service fee (except in the case of Thoroughbred mares) of not more than $10 to insure, such service fee to become due and payable only when mares prove to be in foal.

Any person, firm or corporation owning or controlling any Thoroughbred stallion in regard to which all of the conditions above set forth shall have been duly and properly fulfilled, shall, on production of satisfactory evidence thereof and of the fact that a reasonable number of mares, other than Thoroughbred mares, have been served during the season, be entitled to receive at the close of each such season the sum of $250.00 from the funds of the Live Stock Branch. If, in the event of a horse dying or becoming incapacitated for service during the season, an approved substitute is immediately placed in the same district, the Minist?r may after due consideration of circumstances, authorize the payment of the subsidy above mentioned.

The necessary forms will be furnished on application to the Veterinary Director General and Live Stock Commissioner, Department of Agriculture, Ottawa.

The Pictou and Antigonish Counties' Picnic to the Agricultural College Truro, N. S.

(Continued from page 693.)

sented by the Clydesdale stallion "Royal Baron"; by "Baron Pride"; the Hackney stallion "Cliffe Rosador"; the Thoroughbred stallion "Lucifer II", and the Standardbred stallion' Achille", 2.15 1-4. A great deal of interest was taken in this display of live stock and many questions asked regarding the breeding, feeding and testing of stock.

The following are some of the records of dairy cattle exhibited :

Valuable milk at $1.00 per cwt. or butter at 25 cents per lb., these cows have made a profit of from $30.00 to 60.00 each, and including the extra value of calves produced from such utility animals. Cows of this sort proved the most efficient means of economical production of milk and butter and will make dairying, which here-to-fore has afforded a comparatively small margin of profit, one of the most valuable industries of the country.

Large numbers of visitors are reported by Mr. J. P. Landry, Manager of the Poultry Plant to have taken particular interest in the poultry work.

Many visitors also attended the Experimental and Farm Departments and the various buildings about the farm.

Although the Pictou and Antigonish farmers turned out in greatly numbers in 1910, yet without doubt the interest taken was much more evident in 1911. In the afternoon, the town of Truro offered special entertainment to the visitors by giving an exhibition run of the Truro Firemen and Band Concert immediately before the departure of the picnic trains.

A most pleasant and profitable day was spent by all.

THE
15th-Provincial Exhibition-15th
OF
NOVA SCOTIA
WILL BE HELD AT
HALIFAX
Aug. 30th to Sept. 7th.

A Generous Prize List
A Grand Display of Manufactured Products
An Excellent Programme of Amusements

Entries Close in All Classes AUGUST 12th.

M. McF. HALL, - Manager and Secretary, - HALIFAX, N. S.

The PUBLISHER'S DESK.

W. F. YOUNG, P. D. F.

shaking hands with himself over the success customers are having with his remedies.

Our readers are all familiar with the ABSORBINE advertisements that have appeared in this paper continuously for the past fifteen or more years—and most everyone is familiar with the remedy itself. It is therefore with considerable pleasure that we are able to show you a picture of the manufacturer of ABSORBINE, W. F. Young, P. D. F., of Springfield, Mass.

Mr. Young is well and favorably known by trainers and horsemen in general throughout the country, many of whom have profited by his long and varied experience with horse ailments, knowing him to be willing at all times to render assistance when called upon. 6

He has been manufacturing ABSORBINE since 1891, and has developed a large business, based on the positive merits of the remedy. ABSORBINE is a safe, antiseptic, healing liniment that acts promptly and surely, without blistering or causing any inconvenience, which appeals to all lovers of the horse. For removing bursal enlargements, bog spavins, thoroughpins, puffs, curbs, strengthening broken down tendons, taking out soreness and lameness, allaying pain, no bettter preparation is known.

ABSORBINE has been the means of getting many horses to the races and winning first purses, that otherwise would have been unable to start.

The first train on the Grand Trunk Pacific Railway from Prince Rupert East to Vanarsdol, 100 miles, went into effect Wednesday, June 14th, train leaving Prince Rupert 1.00 p. m. twice a week, Wednesdays and Saturdays, on the arrival of Grand Trunk Pacific Steamships. Returning following day.

Railway Landscape Gardening.

In recent years many of the American railways have given a great amount of attention to the beautifying of the grounds surrounding their stations, freight sheds, etc. The Grand Trunk Railway System have not been behind in this good work as is observed by an editorial in the October number of the "Railway Master Mechanic" published in Chicago.

They say: "If anyone doubts that landscape gardening has no place in railway repair shop operation let him visit the 'gold plated' shops of the Grand Trunk at Battle Creek, Mich. While threading his way through the beds of geraniums, poppies, pansies and orchids which bedeck the grounds, the doubter, if he is a pessimist, will perhaps offer the opinion that probably gardening and not locomotive repairing is the specialty of the shops. Indeed, if the comparisons are carried far enough, one is inclined to wonder if there may not be some connection between this devotion to the aesthetic and results as evidenced in quality and quantity of the output of repair shop work."

The Canadian Newspaper Directory for 1911.

We have just received from the publishers, A. McKim, Limited, of Montreal and Toronto, a copy of the 1911 edition of the Canadian Newspaper Directory.

This is the Seventh Edition of this valuable work, which fills a very real need in Canada, and deserves a place on the desk of every business man, whether he is an advertiser or not.

The Canadian Newspaper Directory lists and describes 1,526 periodicals in Canada and Newfoundland. Of these 136 are daily, 1,102 weekly or semi-weekly 260 monthly or semi-monthly, and 23 are published less frequently. This is a considerable increase over the last edition.

In addition to this, the Directory supplies a comprehensive Gazetter giving the population, the chief industries, the railway, telegraph and banking facilities and other interesting features of every newspaper city, town and village in Canada.

This work contains over 475 pages. It is splendidly bound and is certainly a credit alike to the publishers and to Canadian newspapers generally.

A. McKim, Limited, are particularly well qualified to edit and publish this, the standard book of reference on Canadian publications. They are the pioneers in the Advertising Agency field in the Dominion, the McKim Agency having been founded in Montreal in January, 1889, twenty two years ago, by Mr. Anson McKim, who is still at the head of the business.

During all this time they have been the acknowledged leaders in this line in Canada, and the Agency business has been developed from a very small beginning—then performing only the functions of the middle-man—to a very large producing enterprise which runs into the millions.

It goes without saying then that no other Agency is in closer touch with the publishers of the Dominion than McKim's, and they are therefore able to get the most reliable information. The price of the 1911 Directory is $2.00.

Canadians Invade New Zealand.

Tudhope Motor Co. establish agency in sister Dominion.

Orillia, (date),— Advices from the Tudhope Motor Co., state that Messrs. Easson Limited, of Wellington, New Zealand, have successfully tendered for the agency for the Canadian-made "Everitt," as built by the Tudhope Motor Co., Limited, of Orillia. Mr. Percy G. Easson has been touring Canada in the interests of his firm and in an interview stated that the development of his country is proceeding at as great a rate as that of Canada, although it is not so well advertised. New Zealanders especially welcome trade with Canada and Canadian manufacturers who will take the trouble to investigate will find big market possibilities in New Zealand.

Mr. Easoon, after a careful review of the motor car situation in Canada and the United States, focussed his attention on the "Everitt" and successfully tendered for the New Zealand agency. He predicts heavy sales as the "Everitt" combines the qualities of staunch, up-to-date construction at a moderate price.

Attractions for the Nova Scotia Industrial Exhibition.

As the exhibition opens August 30th, a date which should insure pleasant weather, the management have secured one of the best programmes of attractions ever presented before the Grand Stand.

Read the list:

"THE AUTOS THAT PASS IN THE AIR."—A wonderful and sensation attraction built on mathematical precision and it cannot but elicit wonder and admiration. Watch the two handsomely attired ladies seated in two automobiles, weighing 1200 pounds each, dash down an almost perpendicular incline at terrific speed and the race of daring is on. So great is the velocity obtained that an express train is slow beside them.

At a critical point in circuit both automobiles are shot wildly into the air, the foremost car turning a complete somersault, the second car shooting directly under the first car, missing it by a hair's breadth. Both automobiles finish up the mad race landing one after another on a spring board. A written description can never do this great attraction full justice and you will have to see it to appreciate it.

"THE AERIAL WEAVERS."— As their name implies have woven one of the most wonderful and original aerial acts before the public today and rank among the most daring performers known. Their work consists of dare-devil feats while swinging in mid-air with nothing but their teeth to hold them. They do dances and various other gyrations and conclude with a cyclonic whirl which resembles the aerial swing at a big summer park when the car and occupants swirl round at lightning rapidity and in an almost horizontal position. The act is so daring and different from other serial aerial acts that it commands attention, enthralling the spectators with the intrepidity of the performers and the nonchalance with which they execute the hazardous feats.

"THE MACNALLY TROUPE." — These clever artists perform a potpurri of comedy, and an act excelled for its variety which is considered the essence of entertainment.

It consists of acrobats, tight wire balancing feats, interspersed with good camedy. There is one lady and three gentlemen in this cast and one is equally as clever as the other in his or her particular line, in fact they are voted tip-toppers wherever they appear. There is not a country on the globe in which the wonderful troupe has not appeared, and it would be well for you not to miss them.

"THE MANGEAN TROUPE." — Six as perfect acrobats as the world has produced comprise this act, four men and two women, and their work presents sensation after sensation. They do part of the work from a spring board and with the impetus derived from it they do all kinds of difficult stunts in the somersault line singles, doubles are performed and so gracefully do their bodies fly through the air, that wings, did they have them, could not add to their excellent work.

They land on the shou,ders of the men two and three high with a precision that makes the average man or woman sit up and "take notice." The work of the top-mounter, who is one of the women, is highly sensational.

"DUFFY AND CEREI." — The Comedy Gymnast of today is required to be not only a comedian but an expert gymnast as well, for the reason that he must to a certain degree burlesque the straight work of his fellow artists associated with him in the work. They are both expert performers and their work on the horizontal bars has reched a point of later perfection which is hard to equal.

"TWO JUGGLING ORTONS." — We all like to be clever in anything. Next to being clever ourselves we admire cleverness in others. The subject of this article certainly commands our admiration for they rank among the cleverest in their line, which is that of juggling.

"THE TWO PRANKS."—It is to laugh is an appropriate saying when applied to this duo of eccentric comedians. They are funnier than the funniest. Their trick house stunts and knock about tricks keep the comedy going from start to finish, and of such a spontaneous and unctuous kind as to make it irresistable Come and have a laugh at their antics, for laugh you certainly, will.

STOCK NOTES.

'Ayrshire Cattle for Canada.

Many inquiries have of late been received by herders of Ayrshire cattle in Scotland from farmers in Canada and the United States. No animal is good enough for the Canadian and American buyer which has not a proved milk record of a high standard. Mr. A. W. Montgomerie, Lessnessack, has of late years done an extensive trade with the Dominion and he has just sent out seventy head of choicely bred Ayrshires to the order of Messrs. Hunter, of Maxville, Ootario. They have been selected with great care from the leading herds of the country. The consignment includes five yearling bulls of first class milk record breeding on both sides. A number of the two-years-olds and young cows are meant for the Canadian shows, and some of them will, no doubt, win further honors for the land of their nativity.

Walter E. Eaton, Canard, N. S., writes:—Since I last wrote you I have sold Shorthorns to the following:—To James Inch, for Jerusalem Agricultural Society, N. B., one bull; to John McIntosh, Glassville, N. B., one bull; to C. A. Archibald, Truro, N. S., for parties in Newfoundland, one bull; to S. Bigelow, Canning, N. S., two bulls. I still have three nice, red bulls, fit for service.

Record Ayrshire Sale.

It was expected by all lovers of the breed, that the dispersion sale of Ayrshires advertised by Messrs. Robert Hunter & Sons, Maxville, Ont., on the 28th June would be a success, and in this regard they were not disappointed. It was a world's record sale of Ayrshires. The Secretary of the Canadian Ayrshire Breeders' Association, W. F. Stephen, opened the sale with a brief address,

referring to the grand work done for the breed by the Messrs. Hunter & Sons. Altogether they had imported between 650 and 700 head from Scotland during the past fourteen years, and expressed regret that it was necessary to make the sale, but hoped on behalf of their fellow breeders that the health conditions in the family would soon allow the Messrs. Hunter to again build up a superior herd. Auctioneer A. Philps, of Huntingdon, Que., who so successfully conducted the Benning sale last year, took the sale in hand promptly at 12.45 and knocked off 117 head by 3.30 and realized for the lot $40.490. The eagle eye of Mr. Philps never missed a bid, and his powerful voice could be heard to the farthest corner of the large tent. His ready wit annd brusque speeches when after a bid caused many a laugh, especially so when bidding was keen between American and Canadian buyers. Mr. Philps has no peer as a live stock auctioneer. At times excitement ran high and onlookers could not withhold applause when some particular choice animal was knocked off at a handsome price to a favorite purchaser. The Messrs. Hunter amply provided for the large crowd and catered to their comfort. They had arranged a pavilion surrounded by tiers of seats under a large canopy where comfortably seated all could see the animals and the auctioneer could readily catch the bids. Purchasers were present from almost every province in Canada and from many points in the United States. To give names would be to discrminate, further than to mention that among others president were the President, Mr. Valentine, and the secretary, Mr. Winslow, of the American Ayrshire Breeders' Association. The Americans were the best purchasers although they were pressed hard by some of the young Canadian Ayrshire breeders, notably R. R. Ness, H. Gordon, P. D. McArthur, W. T. Rodden, of Vaudreuil, a new man in Ayrshire circles, P. Ryan, and Mrs. Erhardt, were the keenest bidders of the American buyers, with Shirwin, Wilbur, Sagendorph, Spiekerman and Freeman close followers, while W. F. Stephen has a commission from H. W. Vanderhoff, of Ballord, Wash., and secured 10 head. The handsome cow, Beuchan Snowflower 2nd, (imp) 26071, was the first brought out and at once there was a strife between Mrs. Erhardt and P. Ryan, and she quickly ran up to $950.00 and was claimed by Mrs. Erhardt. Again each wanted Shewalton Mains Swell (imp) 30594, but Ryan was not to be outdone this time so secured her at $750.00. It was when Victor Hugo came out and started at $1000 and ran quickly to $2000, that enthusiasm ran high. Ness, Sagendorph and Ryan all wanted him, but Ryan secured him at $2600.00 the highest known price paid for an Ayrshire bull. He is worth every cent of it too. Space will not allow further comment, further than to say the sale went well and the Messrs. Hunter are gratified with the support accorded them by friends of the breed.

The following is a list of the animals sold with the name of purchaser and price:

BULLS.

Lessnessock Durward Lely (imp.), 5 years, J. B. Wilbur, Manchester, N. H., $550.00; Bargenock Victor Hugo, (imp), 5 years, P. Ryan, of Brewster, N. Y., $2600.00;

BULL CALVES OF 1910.

Auchenbrain Pride, W. T. Rodden. Vaudreuil, Que., $400.00: Toward Point Superior (imp)., J. Speikerman, Greenwich, Conn., $325.00; Springhill Prince, J. P. Barrett, St. John, N. B., $115.00; Netherhall Right Forward, (imp) R. W. Smith, Clanbrissal, Ont., $155.00; Netherhall Paymaster (imp), Montreal Cotton Co., Valleyfield, Que., $125.00; Spring hill Victor King, J. B. Wilbur, $150.; Springhill True Descent, J. Cotton, Naran, Ont., for $75.00; Lessnessock Sir James Miller, Jas. Boden, Danville, Que., $110.00; Springhill Masterpiece, J. D. Rae, Avonmore, Ont., $35.00.

BULL CALVES 1911.

Lessnessock Cashier, Mr. Spooner, Governeur, N. Y., $100.00; Springhill Dorando, A. A. McDonald, Finch, Ont., $25.00; Springhill Royal Salute S. W. Owens, Antrim, Ont., $37.00;

7 calves. $350.00f

Total—117 head, $40,490.00, average $346.66.

The Commandments of Agriculture

When planning this year's work it is well to read over the following ten commandments of agriculture. These have been modified from those written by Dr. S. A. Knapp, of the United States Department of Agriculture.

(4) Use extensive tillage during are following old methods. I was wheat this fall. There is entirely too stand every time then. Besides I

(1). Prepare a deep and thoroughly pulverized seed bed, well drained; break to the depth of eight or ten inches, according to the soil, with implements that will not bring too much of the subsoil to the surface, the foregoing depths should be reached gradually.

(2) Use seed of the best variety, intelligently selected and carefully stored.

(3) In cultivated crops give the rows and the plants in the rows a space suited to the plant, the soil and the climate.

*4) Use ixtensive tillage during the growing period of the crops.

(5) Secure a high content of humus in the soil by the use of le-

Turning Under Clover

Last week I had a piece of clover gumes, barnyard manure and farm refuse, along with commercial fertilizers.

(6) Carry out a systematic crop rotation, with a winter cover crop.

(7) Accomplish more work in a day by using more horse power and better implements.

(8) Increase the farm stock to the extent of utilizing all the waste products and idle land of the farm.

(9) Produce all the food required for the animals on the farm.

(10) Keep an account of each farm product in order to know from which the gain or loss arises.

turned over. It was knee high, out in bloom, and very thick, and will bring a fine crop of corn, besides benefitting the land. But Oh! didn't I catch it from the other farmers who are following old metnods. I was told that "the hay would have paid twice as much as all the corrn you will raise." Yes, but see here; I needed that humus in the soil and if I don't hit it on corn, but I think I will, I'll get it back when I sow wheatthis fall There is entirely too much of this cutting off clover to feed to the stock, and robbing the soil.

They say, "cut the first crop, and let the second, or seed crop, be turned under in the fall and seed the ground." But this method is too uncertain for me. I'd sooner corn the first crop, put in wheat in the fall and sow clover seed among the wheat in March. You can get a stgnd epery time then. Besides I don't feed clover hay. I've seen some of the chronic indigestion, heaves, bloat, etc., caused by stock eating even dry clovers of all sorts,

For good hay give me clean, weedless well cured timothy, with a third or fourth clover. Then you've got a ration. But all the whole world needs clover turned under every few years to repair the foolish soil robbing policy of our ignorant grand dads.—Successful Farming.

The world's most successful medicine for bowel complaints is Chamberlain's Colic, Cholera and Diarrhoea Remedy. It has relieved more pain and suffering, and saved more lives than any other medicine in use. Invaluable for children and adults. Sold by all dealers.

A two cent stamp or a postal card is a mighty small investment for you for you to make in order to get information that will enable you to buy the best farm machinery or seeds or comforts for the home for the least money. Get all the information you can from the advertisers in the Maritime Farmer before you buy.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

REMEMBER! Reeves Munroe, Consulting Electrical Engineer, Taymouth, N. B.

A. STROUT, Kent's Hill, Maine.

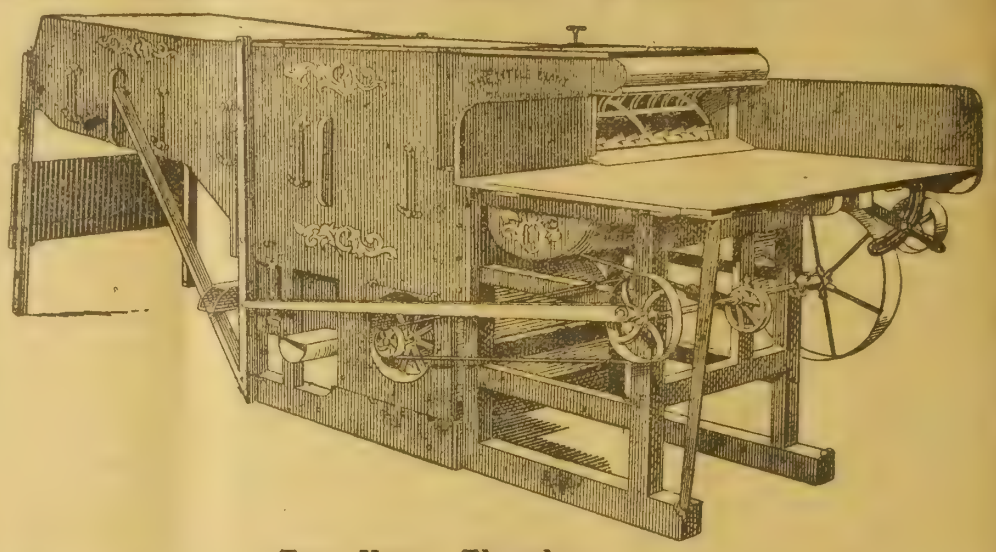
Foot and Mouth Disease in England.

A cable received on July 5th from the British board of agriculture through the high commissioner, announces an outbreak of the foot and mouth disease at Hounslow, Middlesex, England. Thirty-one pigs and one head of cattle are affected, A minesterial order was passed at once, by the Dominion government, cancelling all permits for the importation from England of cattle, sheep, swine, or other ruminants, other than those actually at this date embarked on board vessels bound for Canada.

The Best Judge of a Thresher
Is the Man Who Has Used it.

It's not the purpose of this advertisement to tell in detail the merits of the Howes Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Should any reader wish a detailed description we will mail descriptive catalogue on application.



Two Horse Thresher.

THE SUSSEX MANUFACTURING CO., Sussex, N. B.

DEAR SIRS:—It affords me much pleasure to write that the Threshing Outfit purchased from you has given entire satisfaction. The nearest estimate I can give as to the number of busnels threshed is 60 bush. of oats in one hour.

I find thatthe No. 2 Howes Little Giant Threshing Machine is far ahead of any other threshing machine I have ever used. I remain, Respectfully yours, E. F. CRABB, Greenwich Hill.

There is not much to report in market changes since our last. The crops are coming along nicely and prospects in this line are good. Hay will be below the average crop and much below that of last year. The supply of produce the farmers has now reached a pretty low ebb and prices are likely to be freely maintained for oats and potatoes. Old hay is plentiful but the growing crop being short the farmers are not anxious to sell at present prices and dealers not being able to make a profit even at present prices are not anxious to stock up. Beef cattle are lower, and supply sufficient for requirements. Hides are higher and our quotation may not be the highest price obtainable. Eggs are also higher. Potatoes are quiet also oats and buyers are fairly well stocked especially with the latter. Butter is in good supply and demand slow. Strawberries are just coming on the market and cultivated are retailing at 10c per box. The crop will be short.

FOR SALE.

I am offering my stock bull "Conqueror," 3 years old last May.

One of the best bred Ayrshires ever offered

His dam, qualified for the Record of Performance, and her sire was the sire of two others in the Advanced Registry.

His sire was a champion at St. Louis World's Fair.

Price $125. "Come and see him."

Allandale Farm, Hampton, N. B.

E. A. Schofield, Proprietor.

Pure Water on Tap.

Of all the conveniences on a farm—the binder, hay carrier, automobile, cream separator, etc., all combined—are only minor items in higher civilization if you are not plentifully supplied with the best water, and particularly in your house. A man or woman who has to carry water for general use is not going to use what he should of it

As the folks all know the old saying of the preacher, do as I say, not as I do, I'll confess I would sooner not go on record as having been madly in love with a hydraulic ram, although I have had one for years. But as I say, don't put one in if you can get anything better. And you can now. When I put in another water system, which I shall soon. I'm going to have a pneumatic system. It enables a farmer to give his stock tempered drinking water, a most important feature in its favor. The water only goes into the tank when you start the pump, and it gets no colder than the cellar in which the tank stands. With a ram and open tank on a tower, in barn or in attic, the water gets icy and from there it does bad work with cows when left out to drink on a cold winter day. Isn't this a reason in favor of the compression tanks? But it is not the sole advantage. There is no ram to stop occasionally or no open tank, the overflow of which is not always easily disposed of. Then, too, the water is always cool enough to drink, while that from the elevated tank in summer becomes very warm.

In the compression tank there is also a thoroughly sanitary supply from the fact that no dirt can get at water, and all new water pumped into it aerates that which may have been in some time. You avoid all freezing troubles by simply having outside pipes buried a good depth, which they should be in any case, and you then have a good protection against fire, as you always have a good service pressure. These outfits are really an assured success, as they are installed now in every state. They are made by firms who stand behind the plants for no other reason one will suffice. It and who guarantee that they will hold water and air. You remember how the air power sprayers work. Well, this is the same thing exactly, only larger. With a direct connected engine and pump one of these outfits proves a very neat, compact plant. Although the cost of this system is somewhat higher than most others, you will find the added advantage of it will more than repay the outlay. Simply economize somewhere else, as a good, clean, freeze-proof water system will do more to conserve your hired help and keep your family satisfied than anything money will buy for up-to-date existence on the farm.

One Guernsey Bull, 26 months old, and three Guernsey Bull Calves, dropped in December
One Ayrshire Bull, 15 months old, and a few young Ayrshire Females.
Two Chester White Sows, farrowed in December; young Pigs, 4 weeks old. One Sow to farrow later.

J. F. ROACH, Sussex, N. B.

'Phone 111. "Sunny Side Stock Farm."

ings, as branch wires can be run from the main line to the buildings and thus save wire and simplify the construction. Reference to Fig. 4, in which c, c, etc., represent the buildings to be connected, mn the main line and a and t the branch wires, will make this point clear.

POLES.

Poles twenty-two or twenty-five feet long of any good stock, cut when green, should be used. Cedar and chestnut are particularly desirable on account of their lasting qualities. The poles should be reasonably straight and well proportioned. The diameter

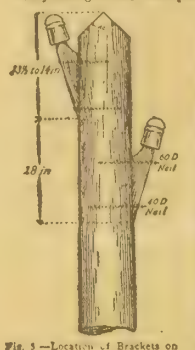

Fig. 5.—Location of Brackets on Pole for Straight Lines.

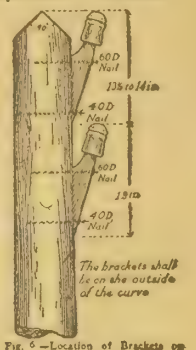

Fig. 6.—Location of Brackets on Pole at Curves.

of the top of the pole should be about 5 or 6 inches. In order to prolong the life of the poles and add to their attractiveness, all the bark should be removed, knots trimmed close and the butt cut off square. The top of the poles should be roofed as shown in Fig. 5.

POLE FITTINGS.

Where only one or two line wires are to be mounted on the poles, oak brackets fitted with glass insulators are fastened to the pole as indicated in Fig. 5 for straight lines, or as shown in Fig. 6 at curves. The brackets should be attached to the poles before the poles are raised.

Fig. 7 Fig. 8 Fig. 9

BRACKETS.

Brackets Figs. 7 and 8 are usually made of oak and given two coats of metallic paint and have a thread on the upper end to which is fastened a glass insulator, a type, as used in telephone work, is shown in Fig. 32.

They should be about 18 inches apart. The upper bracket should be 8 inches from the top of the pole

WE Send This VOLUME FREE BUT ONLY ON REQUEST

THIS book consists of 100 solid pages of carefully compiled information on the building of rural telephone lines. It is well printed, profusely illustrated and handsomely bound in stiff, cloth-covered binding. Apart entirely from its actual cost of printing and binding, the preparation of the technical matter in it has run into a great deal of money. That is why we ask for the coupon —we want to be sure that you are interested in the subject, before we go to the expense of sending you this book dealing with

The Complete Story of "How to Build Rural Telephone Lines"—Use the Coupon

The two pages shown above give you an idea of how thoroughly this book covers every detail. Every other page in the book is just as full of information as the pages shown. Among the matters dealt with in this volume, is the organization of mutual-companies, of stock-companies, line construction, equipment, costs of construction, companies already organized, their history and what they have accomplished, government regulations on the subject—in fact, every detail you could possibly think of or need to know. If there is no telephone system in your community to-day, it is only a matter of time until there will be one. Farmers are organizing community-owned systems all over the country. Some day one will be organized in your locality. You owe it to yourself to know the facts, for knowing the facts may mean money to you. Send for the book—use the coupon NOW.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste —Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education.
It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, Nova Scotia

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course begins NOVEMBER 1st, 1911.

Next Short Course for Farmers and Farmers' Sons begins JANUARY 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 2nd, 1912.

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmer's sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

THE LEADING BREEDS OF SHEEP
Their Origin, Development and Characteristics.

By J. B. Spencer, B. S. A., Ottawa.

The Cheviot.

THE Cheviot, although not familiar to the sheep farmers of Canada, is becoming a favorite breed wherever given a fair trial. Coming as they do from a rugged country they posses a peculiar adaptability for hilly sections where daily attention cannot be given.

The Cheviot is one of the oldest of the modern breeds of sheep. It is classed with the mountain breeds and comes next in hardihood to the Black-Face that inhabits the Highlands of Scotland. Its home is the hill lands bordering Scotland and England, where they have been reared from a very remote period. In their native homes they are given no shelter and graze the year round on the mountain sides and in the valleys. This open air life has developed in the Cheviot one of the hardiest of the medium-woolled breeds of sheep.

It was about 1756 that an effective attempt was made to improve the Cheviot. During that year four leading breeders visited Lincolnshire and returned with fourteen rams which they used upon their flocks with great success. It is stated that the flock of Mr. James Robson, of Philhope, was so much improved by the Lincoln cross that for many years he sold more rams than one-half of the hill-farmers put together.

Cheviot Ram

The breed was named about 1792, when it was described as a fine-woolled breed. From 1800 to 1860 the Cheviot sheep was more and more on the ascendment and the Black-Faces disappeared from nearly all of the best farms in the south of Scotland, except in the mountain districts of Ayrshire and Lanarkshire. Owing to a series of sehere seasons the tide turned in favor of the Black-Faces on all but the lower and grassy slopes of the mountains, where the Cheviot until this day maintains its position.

They are of medium size, approaching the Shropshire in weight. Ewes weigh from 150 to 160 pounds and rams from 180 to 225 pounds. They are white-faced and hornless and are possessed of unusual length of body in contrast with the heath sheep of North Britain. Like most mountain breeds they are relatively light in the fore-quarters, but their hind-quarters are very well developed, producing legs of mutton of very high quality. The mutton of the Cheviot like that of other mountain breeds, is of excellent quality. It seldom becomes too fat, developing rather a plump carcass of mixed fat and lean which is possessed of fine flavor and tenderness.

The wool of the Cheviot belongs to the middle class. The fleece has a tendency to openness and is somewhat longer and coarser than the best type of Shropshire staple, and is rather superior in quality to that of the Oxford. Ewes shear from 6 to 9 pounds and rams from 8 to 12 pounds of unwashed wool.

The Cheviot is possessed of extraordinary constitutional vigor. It is highly prolific, the ewes yielding twins more than single lambs. The ewes are unusually attentive to their offspring, which are rapid growers, making a dressed weight of 50 to 60 pounds at six months old.

In a general way the form of the Cheviot is much the same as other good mutton breeds. The head, while not too heavy, should be bold and broad, well set off by a bright dark eye and erect ears of moderate length. The nose is Roman in type, the skin around the mouth being black. The legs, face and ears are covered with clean, hard, white hair.

The Cheviot is peculiarly adapted to hilly and rolling sections. It thrives well on even scant pasture, provided it has access to an extended area, and fattens readily on roots or good pasture or fodder, even without a grain ration. The breed is thoroughly at home in the Maritime Provinces and the more rugged portions of Quebec, where a few flocks are now being kept.

The Lincoln.

The origin of the Lincoln breed was a race of heavy-bodied sheep that inhabited the low alluvial lands of Lincolnshire, and the adcoast of England. These sheep joining localities, on the eastern were large and coarse, carrying ragged, heavy fleeces of oily wool that nearly swept the ground. They had flat sides, hollow flanks and big shanks and feet and were deficient in the leg of mutton. They grew and fattened slowly but made much inward fat, although their flesh is credited with being well flavored and fine in grain. When the improved Leicester came into prominence, toward the end of the eighteenth century, leading Lincoln sheep breeders obtained rams which they crossed upon their flocks. By this means the coarseness of their stock was much reduced and in time a new and finer type of the breed was produced.

With improvement in the sheep stock there came a more advanced system of farming in which heavy crops of roots and fodders were the chief production. With the consequent better feeding of the stock and the increased care given to breeding the improved Lincoln became fixed in character as the heaviest producer of mutton and wool in the world. It is chronicled that in the early days of the breed two-shear sheep frequently dressed over 90 pounds to the quarter, and a lamb 14 months old gave a fleece weighing 26½ pounds.

The Lincoln was first recognized as a pure-breed by the Royal Agricultural Society of England in 1862. Previous to that date all of the long-woolled breeds were shown together, and according to reliable history the Lincolns were usually victorious. They were then, as now, an excellent breed of wool and mutton sheep. They mature early, fatten easily and make rapid gains for the food consumed, but on account of their size require plentiful supplies of food. Their flesh inclines to coarseness after the animals have reached maturity, but lambs and yearlings dress well and produce meat of good quality.

The wool of the Lincoln is unexcelled for weight of fleece and length of fibre, and its fineness is about equal to that of the Cotswold. It is highly valued for the manufacture of coarse worsteds and is in special demand for braids and other manufactures which call for long fibre and great strength. The usual clip of well kept flocks runs from 10 to 14 pounds for ewes, and 12 to 18 pounds for rams, of unwashed wool. A year's growth of wool is about eight inches.

As a grading sheep the Lincoln stands high where greater weight of carcass and fleece are desired, but for the best results the grade offspring should not be kept on sparse or rugged pastures. Lincoln rams have for many years been in keen demand for increasing the size and fleece of grade Merinos in the Western States of the American Union, Argentina and Australia. At the annual sales of some of the leading breeders in England rams bring very high prices, many of the best specimens going

to Argentina. The chief outlet for the Canadian breeders is the western range States which each year take a good number at paying values.

The breed is white-faced and has a conspicuous tuft on the forhead. The head is massive but not coarse; the nose is somewhat arched and bare of wool. The brisket is full and deep, the body round and well proportioned, and while it is a heavy sheep it is not coarse. It does not reach the weights of its progenitors in carcass or fleece, but on account of its improved quality, brought about by many years of continuous careful breeding, it is very desirable for its mutton and wool and for the improvement of the common flocks. Mature rams in good flesh reach average weights of 250 to 300 pounds, while good specimens of ewes tip the scales at from 220 to 250 pounds. Highly fitted show-yard specimens frequently reach greater weights.

Compared with the Leicester and the Cotswold, the Lincoln is more massive than either but more nearly resembles the latter in outline. It is rather less active, carrying the head lower on account of possessing a shorter, thicker neck.

(Continued next issue.)

Lincoln Ram.

Clogged Burners.

If the burners of the incubator and brooder lamps get clogged and give off a bad smell, boil them out in strong soda water and brush them with a stiff brush. See that the air shaft is clean. Keep the wicks clean by changing them once or twice during the season. The soiled ones may be boiled out, dried and used again. New wicks are cheap, so don't use the old ones till they are so gummed with impurities as to impair their usefulness. Ill smelling lamps are an abomination. They not only render the air unfit for the chicks to breathe, but dirty wicks do not furnish so much heat as clean wicks and burners.

Effect of Succulent and Non-succulent Fodders

On Quality and Quantity of Milk.

An attempt was made at the Kansas State Agricultural College Experiment Station, during the winter of 1909 to 1910, to determine the effect of succulent and non-succulent corn fodders upon the quality and quantity of milk produced by milch cows. For this experiment, the succulent corn fodder was obtained in the form of field cured corn fodder. The corn for silage and for field cured fodder was planted, cultivated and harvested in the same way at the same time and in the same field. The only difference between the two was that one was cut into about one-inch pieces before it was put into a silo and the other was dried in the field and cut into about one-inch pieces just before feeding.

Originally, twelve cows were put under this experiment, but unfortunately, six of them had to be taken off the experiment at the end of the first feeding period of thirty days. Four other cows were substituted and the experiment was continued for two more periods of thirty days each, allowing one week preceeding each period for adjusting the feeds and for letting cows get accustomed to the changed ration. The cows under this experiment were mostly grade Holstein-Friesians. The half of this herd was fed with field cured corn fodder and alfalfa hay, supplemented with grain mixture of wheat bran and corn chop, and extra corn chop. The other half was fed with corn silage and alfalfa hay, supplemented with the same grain mixture. The rations were interchanged at every period.

During the experimental periods, the yield of milk from each cow was kept and a sample of milk was taken at each milking from each cow. The sample was tested for butterfat by the Babcock method, and from the lactometer reading was at 60 degrees F. the percentage of solids not fat was calculated. The acidity of the milk was also taken from each sample throughout the entire experimental periods.

Besides these regular tests, a sample of each milking of a cow from each lot, was analyzed as to sugar, casein, albumin and ash contents by the method adopted by the Association of Official Agriculturists of the United States of America. Analyses of feeding stuffs were also made and nutrients consumed were calculated.

In order to avoid incumbency of a great number of figures, the details of the results of the experiments are omitted and only the summary results will be given.

THE EFFECT ON THE YIELD OF MILK.

The average daily milk yields, when cows were fed corn fodder and then changed to corn silage, and when they were fed first corn silage and then changed to corn fodder, are given below. As the milk flow of cows usually declines as the lactation advances, it is unfair to compare simply the milk flow of one period with that of next period. Therefore, the value of succulency of feed for the dairy cows will be compared by the way that the cows kept on giving milk. The following data shows the decline of milk yield when cows were first fed with corn fodder then changed to corn silage, and when they were first fed with corn silage and then changed to corn fodder.

AVERAGE DAILY YIELD PER COW.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to silage	27.48 lbs.	25.32 lbs.	2.16 lbs.	7.86
From corn silage to fodder	27.55 "	23.64 "	3.91 "	14 19

The above table shows that there was considerable decline in milk flow in both cases. Furthermore it shows that the milk flow during the first period was practically the same, there being a difference of only .07 pound in favor of the lot receiving corn silage first. While there was a decline in both cases, the rate of decline was not the same, when the rations were changed. When corn fodder ration was changed to corn silage ration, there was 2.16 lbs. decline and when corn silage ration was changed to fodder ration, the decline was 3.91 pounds. Expressing this in other words, the decline in milk flow was 7.86 per cent when the change of the rations was from fodder to silage, while the decline in milk flow was 14.19 per cent when the change was from corn silage to fodder. These data show clearly that the decline in milk flow was far greater, nearly twice greater, when succulent feed was taken off the ration than when succulent feed was put into the ration.

THE EFFECT ON THE YIELD OF BUTTERFAT.

The following data show the decline of butterfat yield when rations were changed from corn fodder to silage and when they were changed from silage to fodder:

AVERAGE DAILY BUTTERFAT YIELD.

	1st Period	2nd period	Decline	Per cent. decline
From corn fodder to corn silage	.9835	.8835	.1000	10.16
From corn silage to corn fodder	1.0154	.8313	.1836	18.18

Again there was a decline in both cases. The percentage decline was 10.16 per cen?. in case where succulent feed was introduced but it was 18.18 per cent in case where succulent feed was withdrawn from the ration. The percentage decline of butterfat yields was greater than that of milk flow. This was due to the fact that the percentage decline of butterfat test which will be shown below, was greater than that of milk flow.

THE EFFECTS ON BUTTERFAT TESTS.

The results of the experiments on butterfat tests were as follows:

AVERAGE BUTTERFAT TEST.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to corn silage	3.562	3.499	0.063	1.77
From corn silage to corn fodder	3.768	3.601	0.167	4.43

There was also a decline in both cases. The decline in butterfat test when the non succulent ration was changed to the succulent ration was very slight, being only 0.063 per cent or percentage decline of 1.77 p. c. On the other hand, when succulent ration was changed to non-succulent ration it was 0.167 per cent, or the percentage decline of 4.43 per cent., which is more than twice greater than the other.

THE EFFECT ON SPECIFIC GRAVITY AND THE PERCENTAGE OF SOLIDS NOT FAT.

The results on specific gravity of milk was as follows:

AVERAGE SPECIFIC GRAVITY.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to corn silage	1 02952	1 02887	.00065	2 20
From corn silage to corn fodder	1.03011	1.02937	.00074	2 44

AVERAGE PERCENTAGE OF SOLIDS NOT FAT.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to corn silage	8.098	7.948	0.150	1.85
From corn silage to corn fodder	8.225	8.066	0.159	1 93

There was not much decline in either case and the decline in both cases was just about the same, yet the favor was on the succulent ratioa in every case.

THE EFFECT ON ACIDITY OF MILK.

The data given below is the acidity expressed in percentage calculated as lactic acid. It must be understood that the acidity herewith given is the acidity of absolutely fresh milk as it is drawn from cows, and not the acidity developed after standing. For this reason it is false to give the acidity of fresh milk in percentage of lactic acid, but it is almost the universal practice in the United States of America, to express the acidity of milk in term of percentage calculated as lactic acid. Therefore, the writer followed the general practice so that the work is comparable. It matters not much whether the acidity is expressed in terms of percentage of lactic acid or in term of degree as often practiced in European countries, so long as the same mode of expression is used, the work is always comparable.

There was practically no change in acidity of milk attributable to the change of rations. There was, however, a slight, namely .001, increase in acidity when non-succulent ration was changed to a succulent ration, while there was a decline of .002 in case when the change was from succulent to a non-succulent ration. This again is in favor of succu,ent ration. The writer has studied the question of acidity of fresh milk quite thoroughly, and is convinced of the fact that so long as the acidity of fresh milk is high, the cows that are giving that milk are in a prime condition for milk production. When acidity of fresh milk declines perceptibly, there is usually something wrong with cows physiologically, and invariably decreased considerably in milk flow. On the other hand, when the acidity went up the milk flow was also increased. That the acidity of fresh milk is highest at the beginning of lactation and lowest at the end of lactation, proves this fact. Of course,the acidity of milk steadily decreases during the first stages of lactation, while the milk flow increases. At this stage milk is not normal, hence acidity cannot be normal. It appeared to the writer that when the acidity of colostrum of a cow was very high, that a cow usually was in the best condition to out in milk. On the other hand if the acidity of colostrum is low, namely below 3, the cow never did well, no matter what her constitution

AVERAGE ACIDITY.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to corn silage	.180	.1s1	-.001	-.55
From corn silage to corn fodder	.182	.181	.002	1 09

may be. Besides these facts, milk testing high in acidity was rich in total solids and had the best flavor, while of milk testing low in acidity, the contrary was true.

THE EFFECT ON OTHER CONSTITUENTS OF MILK OTHER THAN BUTTERFAT.

The result of the analyses of milk from two cows at each milking for three periods are summarized as follows:

SUGAR CONTENT.

	1st Period	2nd Period	Decline	Per cent. decline
From corn fodder to silage	4.631	4.372	.259	5.59
From corn silage to fodder	4.622	4.406	.116	2.56
CASEIN CONTENT.				
From corn fodder to silage	2.095	2.233	-.138	-6.59
From corn silage to fodder	2.152	2.130	.022	1.02
ALBUMIN CONTENT.				
From corn fodder to silage	.885	.876	.909	1.02
From corn silage to fodder	.939	.829	.110	11.72
ASH CONTENT.				
From corn fodder to silage	.703	.714	-.009	-1.28
From corn silage to fodder	.721	.709	.012	1 66

Studying the above data it may be noticed that the composition of milk did not alter very much. Increase in percentage composition of casein and ash was noticed when non succulent ration was changed to succulent ration. In all other cases the percentage composition of milk was in decline. Decline was greater when non-succulent ration was changed to succulent ration in percentage composition of sugar. This was the only case where non-succulent ration showed the superiority as feed over succulent ration.

THE EFFECT OF BODY WEIGHTS ON COWS.

The cows receiving corn fodder ration weighed on the average, 1102 pounds at the beginning of the period and 1095 at the end. The cows receiving corn silage ration weighed 1072 pounds at the beginning and 1073 at the end. These figures show that the cows receiving corn fodder ration lost in weight during 30 days 7 pounds, or a daily loss of 23 lbs. On the other hand, the cows which received the corn silage ration practically maintained the body weight. To be more exact, they gained on an average one pound in 30 days, or a daily gain of .03 pound. This result again favors the succulent feed for dairy cows.

THE EFFECT ON CONSUMPTION OF NUTRIENTS.

In order to see how cows utilized the total nutrients in the non-succulent ration for production of milk the following data was given:

POUNDS TOTAL NUTRIENTS CONSUMED.

		Ash	Crude fiber	Nitrogen free extract	Crude protein	Ether extract	Total dry matter
Milk per cwt.	Corn fodder ration	7.27	28.15	66.62	14 36	2.80	119 20
	Corn silage ration	6.93	24.80	56.42	12.94	3.46	104 55
	Difference	.34	3 35	10 20	1.32	66	14.65
	Per cent. difference	44.62%	13.51%	18.08%	10.20%	-19.05%	14.01%
Butterfat per 1 lb.	Corn fodder ration	2.05	7.96	18.86	4.06	.79	33.72
	Corn silage ration	1.90	6.79	15.46	3.54	.94	28.63
	Difference	.15	1.17	3 40	.52	-.15	5.09
	Per cent. difference	7.89%	17.23%	21.99%	14.69%	-15.95%	17.77%
Solids not fat per lb.	Corn fodder ration	.91	3.53	8.37	1 80	.35	14.96
	Corn silage ration	.84	3.03	6.89	1.58	.42	12.76
	Difference	.07	.50	1.48	.22	-.07	2.20
	Per cent. difference	8.33%	16.50%	21 46%	19 39%	-16.66%	17 24%

It can be noticed that cows receiving the succulent ration consumed a far less amount of all the constituents of feeds, except ether extract, than those receiving non-succulent ration, for production of unit amount of milk, butter fat and of solids not fat. When cows received non-succulent ration they consumed over 14 per cent more total dry matter to produce milk, nearly 18 per cent more to produce butterfat and more than 17 per cent more to produce solids not fat. Though the cows consumed more nutrients from a non-succulent ration, they not only were unable to produce more dairy products, but also were unable to maintain their body weight. That is they produced milk at an expense of their body.

SUMMARY OF THE RESULTS.

The results of this particular experiment may be summarized as follows:

1. The decline of milk yiled when succulent ration was changed to non-succulent ration was 80.53 per cent. more than when non succulent ration was changed to succulent ration.
2. That of butterfat yield was 78.93 per cent more.
3. That of butterfat tests was 150.28 per cent greater.
4. That of specific gravity of milk was 10.91 per cent. greater.
5. That of percentage of soliids not fat was 4.32 per cent greater.
6. That of acidity was 298.18 per cent greater. In case of acidity, however, there was increase when the non-succulent ration was changed to succulent ration while the contrary was true in the other case.
7. That of all other constituents of milk were similarly greater except of sugar content. The sugar content of milk decreased far greater when non-succulent ration was changed to succulent ration. This result was obtained obly from two cows, and therefore needs further investigations to be proved or disproved.
8. When cows received non-succulent ration they consumed 14.01 per cent. more total dry matter for a production of unit amount of milk 17.77 per cent more for butterfat production and 17.24 per cent more for solids not fat production, than when cows received succulent ration.— A. Miyawaki, Kansas Experimental Station.

Warbles of Cattle.

Every farmer knows the "warbles," which are usually present during this season of the year in the backs of cattle. Stock raisers and others are aware of the damage and loss entailed by the presence of the maggots, which cause these warbles or tumors, viz., the loss of flesh, reduced milk producing power and enormous injury to the hides by their being pierced with holes. In 1880 Osborn estimated that the annual loss in the United States caused by this insect was ninety million dollars. It is undoubtedly one of the most serious insect pests affecting cattle in Canada, and at the sme time one which is difficult to control.

The warbles are caused by the maggots or larvae of the Warble Fly. There are two common species of which Hypoderma lineata is the species occurring in North America. The life history of this insect is an interesting one athough the maggot's method of entry into the body after emerging from the egg, is not yet known with certainty. The Warble flies which are the parents of the maggots, resemble small bumble bees and are covered with black and yellow hairs. They are found flying in the fields from June to the end of August, and, although they do not bite or sting the cattle, they frequently cause them to stampede on hot days.

LIFE HISTORY OF THE INSECT.

The flies deposit their eggs on the hairs of the animal, especialy on the legs, and the eggs are firmly attached to the hairs. When the young maggots hatch out they may either bore their way directly beneath the skin, or they may be licked into the animal's mouth. In the latter case they wander through the gullet and penetrate the tissues, in which they have been found wandering, finally arriving beneath the skin of the back about February. Here their presence and growth give rise to the "warbles," and in a short time a hole is made in the skin through which the maggot now breathes. In about two months, that is about the end of April or beginning of May, the maggot is full grown and measures about an inch in length; it now works its way out of the warble and drops to the ground. Here it forms a brownish black case from which the fly escapes about four or six weeks later.

A large number of experiments in different countries have conclusively shown that smearing the backs of cattle during the summer with various dips and smears, as is recommended and practised to prevent egg laying, is useless.

REMEDIAL MEASURES.

The most satisfactory remedial measure is the destruction of the maggots in the spring before they leave the warbles. If this is done it is clear that these maggots will not produce flies. This can be accomplished in two ways; by squeezing out and by smearing.

When the warbles are ripe the maggots can be readily squeezed out by sides of the warbles. If the skin is the application of pressure to the hard it can be softened by washing with a salt solution (½ lb. of salt to 3 gals. of water.) In certain districts in Denmark the farmers have co-operated in this work and by a systematic destruction of the maggots by extraction a marked decrease in the presence of warbles has been brought about. The first inspection should be made in April and another in May, each animal being carefully examined. After the extraction of the warbles the wounds heal.

The warbles are smeared with a substance which fills up the breathing holes of the maggots which are therefore destroyed. A smear composed of equal parts of pine tar and kerosene has been found to be effective in killing the maggots. This method, however, is less to be recommended than that of squ?ezing out.

Cattle should be allowed to have access to water wherever that is possible and to the shade of sctes, as considerable relief from the attention of the flies is gained by these means. —C. Gordon Hewitt, Dominion Entomologist.

The Compost Heap.

Very few farmers realize the benefits to be derived from a good compost pile. Florists and market gardeners appreciate its value and have very large compost piles every year. They use sod, leaves, loam and manure for their compost piles. Farmers on the other hand can use all their waste products for compost piles. The dish water, soap suds, hen house cleanings and all waste litter and other fibrous materials which sometimes accumulate and have to be disposed of regularly can be put into the compost pile and used to advantage. Decayed pumpkins, squashes or other vegetables or weeds that have gone to seed should never be thrown into a compost pile.

In Germany, the compost pile in the front yard is just as familiar a sight as a woodpile is in our backyards. The Germans save everything that has any fertilizer value at all, and as a result get dp a fertilizer almost nothing. We probably will never carry it so far as they do, but can profitably be taught a few things by them. Start the compost pile some day by ploughing up some pasture sod and carting it to the location of the pile. Now alternately put on a layer of sod and manure. Add all the waste matter as suggested above, and dig over the pile every month or six weeks. The compost can be nsed for the flower beds, flower pots, hotbeds, cold frmes, seed boxes, and all other places where a good rich soil is needed. On the other hand if we will take a lesson from the Germans, we can make the compost pile so rich as to be able to use it for a fertilizer in the garden.

Feeding Small Pigs Potatoes.

M. S. C.,—I have some little pigs just weaned and a lot of potatoes, and also some milk, but not enough for them. I have never fed such small pigs potatoes and want your advice.

Ans.—We see no reason why you will not be able to get satisfactory results by feeding potatoes and milk to pigs just weaned. If these potatoes could be cooked without too much inconvenience it would be an advantage, as they consist mostly of starch, the cells of which are broken up by heating and made somewhat more digestible. With food rich in protein, cooking is injurious, as it coagulates the albumen. Starch foods however, like potatoes, are improved by the cooking process. A combination consisting of four pounds of milk to one pound of cooked potatoes would give a very well-balanced ration for pigs of that age. If you do not have enough potatoes and milk you could feed some grain additional. There would be no particular harm in giving these pigs all of the potatoes and milk they wish to consume if you habe a sufficient quantity on hand.

BOYS AND GIRLS ON THE FARM.

There is always a considerable controversy and discussion about the question of keeping the young folks on the farm. It would be ideal of course if one generation should follow another on the same homestead thus perpetuating certain lines of work and carrying to a successful termination lines of live stock breeding. The life time of one man is often too short to develop a strain or family of stock and if it is possible to hand the work down from father to son, if the farm must be sold and the operations that have been started discontinued, much work of interest will be sacrificed. Nevertheless it is hardly advisable to think that every young man and woman that is born upon the farms of this country will continue upon these farms until old age. If this were the case, what would happen to the cities? If it were not possible to draw upon the farms for the business men, if generation were to follow generation in the city, we would soon develop two distinct classes of society and in the course of a few life times this distinction would be well marked. It is also necessary to have an interchange from time to time; that is, it is necessary for the boys who have developed strong vigorous characters in the country to undertake work in the city. It is also necessary for many to leave the city and go to the country. Both city and country life are necessary and it is only through an interchange that the best social results can be obtained. This, however, does not relieve one of the responsibility of doing everything that he can to make farm life attractive for the boys and girls. Here is one of the things that will hold them to the old homestead. If work on the farm is looked upon as drudgery by the father and mother, it will not take the children long to view it in the same light. On the other hand if the parents teach in a direct and indirect way that farm work is just as profitable, just as ennobling and honorable as any other of the professions, the child will soon begin to respect the work that his father is carrying on and will consider it an honor to have the privilege of succeeding his father in years to come. The truly systematized farm home will give each child a share in the work and also a share in the profits. The ideal plan is to let every member of the family have some property that is distinctly his own. This develops a pride of ownership and it stimulates in the young folks an appreciation of the farm and farm stock. Dairying fits in splendidly with every system of farming and especially with this plan for there is no line of work that is more easily taken up by the children than certain phases of dairying. For instance a boy of 10 or 12 can take hold of the cow testing proposition and do work that will mean many dollars to the dairymen every year. The girls can find lines of work that will be congenial and profitable at the same time. If each child is given a calf or a pig or some chickens and is instructed in the best management and care of these and if the profits derived therefrom are turned over to the child exclusively, it will not be long before the most alluring proposition will not draw these young people to the cities. Furthermore the farm home should be handy and convenient. There is nothing that is too good for the farmer's wife or his family. Too frequently men are willing to spend money for machines and conveniences that are considered necessary out of doors but are very slow to put modern conveniences in the home. If the house is merely a sheltering from the elements there is a much greater chance of losing the child's interest. If it is a real home that is happy and is equipped with those things that make life really worth living, the child's interest will center there and he will be strongly attached to his surroundings. The children may well be supplied with games and sports that are healthful and invigorating. Every farm yard should have a tennis court if the children wish it and the farm work should be so arranged that there is time occasionally to use these grounds. Make home a happy and attractive place, give the young folks an interest in the farm work and then there will be less difficulty in keeping them interested and on the farm.

FATHER, SON & CO.

Father, Son & Co., is a corporation formed of the most vitally interested parties for the management and exploration of the farm. With father and son representing the business side of the venture, with the company managing the house and and making the home, it is an ideal busisess arrangement. In such a partnership all the interests of life are united. There are no office hours to make a slave of the men, and each member in furthering the interests of all betters his own condition. It is conducted on the profit sharing plan. This is the ideal arrangement when the son sees his best interests is carrying on his father's work. It is the ideal arrangement that many fathers hope for in vain because the son is unwilling to remain on the farm.

Some boys find farm life absolutely distasteful, and some find business or the professions distasteful. If such a business arrangement seems impossible, if the son insists on leaving home, coercion will probably be of no use, and may do harm rather than good. If the boy feels that he must try his fortune alone, don't let him leave home under a cloud of estrangement. A boy is unlikely to make a success of a business that he undertakes merely to satisfy someone else. It is true that many boys leave the farm without any definite idea of what they are getting into, whether or not the new work will be pleasant or profitable. It is true that too many leave the farm because they have no liberty no wages, and no business standing at home, and start out for themselves in order to be independent. It is a mistake to censure a boy because he plans to leave home. Show him rather, the partnership that could be formed with his father, talk with him as though you appreciate his feelings, reason with him, show him you need him and he needs you and you can both help each other. But if he insists upon going away after all your advice, don't let him go feeling that estrangement has cut him off from his home, that hostility awaits him if he should ever care to come back. It is a hard problem to solve, the boy question; it is hard to know how much liberty to give or how much restraint to use. But sympathy with his feelings and undertakings of his views will help a lot. If you try to see things as they look to your boy, you will come closer to him and have more influence over him than you would otherwise.

Men deal with these problems in various ways with varied results. Arguments that would appeal to one boy may carry no weight with another. If your boy leaves home to try his luck in town, the experience he gains may be his best lesson. Many boys have failed miserably and would have been drawn back to their homes if they had felt sure that sympathy and understanding awaited them. Knowing that hostility and censure were there, they have persisted in being poor business men or mediocre clerks, while the father was forced to get along with inefficient and uncertain help. Tell your boy as early in his life as possible, that he is a junior member of the firm of Father, Son & Co. Talk over your plans with him, give him for his own a share—however small—in the profits; whenever possible use his suggestions, or adapt them to your use, and see how proud he will be of his business connection. Take him into the firm early—the chance of sharing his future is capital enough to admit him to full partnership.

THE FARMER OF TO-DAY.

At a recent meeting of the Holstein, Friesian Association, President Woods said:—

The time was, within the memory of your president, when the name of farmer was an opprobrious term; when the title of farming was applicable to those men of least intelligence, of least consequence, of least moral and financial strength; in fact, of least importance in the community in which they lived. Not only was this true, but he was supposed to be steeped in ignorance, without ambition, without stability, and even without hope. He was supposed to be engaged in that particular vocation because of his unfitness to do anything else, and his especial fitness to do that alone; it was an almost universal custom, when men failed in everything else, to then direct their attention to some agricultural undertaking.

The foundation of such opinion long since disintegrated; there was never a greater revulsion of sentiment, never a greater revolution in practice. To-day the leading men of this continent are the men who spend a part or all of their time in solving the great problems of nature, in laying the foundation at their country homes for unalloyed happiness and extreme longevity; who bring into existence and rear, in a sensible and intelligent manner, boys and girls destined in after years to take their places among the first and foremost. No vocation is today recognized as so lofty, so desirable, so profitable, so exacting, as this same association with nature. Indeed, "It makes all mankind akin." It is true, as hath been said in the language of another:—

> "To him who in his love of nature holds
> Communion with her visible forms, she speaks
> A various language; for his gayer hours
> She has a voice of gladness and a smile
> And eloquence of beauty, and she glides
> Into his darker musings, with a mild
> And healing sympathy, that steals away
> Their sharpness, ere he is aware."

Today, farms are rapidly passing into the control of the most candid, upright, intelligent, and profoundly educated men and women that the country affords, and the title, farmer, has now become one of the most dignified, comprehensive, honorable, and desirable appellations which can be applied to man.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces ?

Cultivation of the Alfalfa Crop.

Every tiller of the soil knows, or at least should know, precisely why he cultivates growing crops. If he knows the precise end that he hopes to attain by such cultivation he will adapt the method of his cultivation so as secure the end he has in view. The benefits of cultivation may be briefly stated as follows.

It puts the soil in condition to receive and retain the moisture that is used in the production of the crop; it changes the granular structure of the soil making it permeable to the roots of the plant in their search for plant food; it aerates the soil bringing to the roots of the plants the necessary oxygen for root respiration and also helping to put the crude plant food that is in the soil in a condition in which it will be available for immediate plant use; it also by stirring up the vital processes of plant growth; it eradicates weeds which tend to minimize crop production by robbing the soil of both moisture and plant food and to place the growing crop at a disadvantabe in its struggle for the necessities of life.

WHY CULTIVATE ALFALFA ?

Alfalfa is no exception to the general rule of the benefit to be derived from the cultivation of growing crops. On the other hand allalfa seems to thrive better under cultivation than the majority of farm crops.

The question is frequently asked when should alfalfa be given this cultivation? In the early spring as soon as the ground can be worked and if possible before the new buds have started their growth in order to stimulate this new growth and to break up and aerate and render active the soil which has lain all winter in a state of dormancy. As soon as a cutting of alfalfa has been removed the field should again receive thorough cultivation. If a field of alfalfa is examined just before it is cut it will be found that the surface of the soil having been shaded from the sun and protected from the wind by the rank vegetable growth is moist and soft and congenial. As soon as the crop is removed this surface is immediately exposed to both sun and wind and dries out, bakes, hardens and cracks, and becomes anything but friendly to plant growth. Thorough cultivation will at once remedy this condition of affairs and should not be delayed.

BEST ADAPTED IMPLEMENT.

But the principal question is, "What implement is best adapted to this cultivation?" Three different implements have hitherto been employed for this purpose and there are certain definite objections to the use of each one of the three.

In certain sections of the state, where the soil is light the common harrow has been used to advantage, but over most of the state the soil is too heavy for the harrow to do really efficient work. This matter of cultivation if undertaken should be thoroughly done. The soil needs cultivating not merely irritating.

Other growers of alfalfa use the common disk. This does very well where the soil is light enough so that a dull disk without being set at a full angle will do efficient work, and where there is so little firmness in soil that the alfalfa root when struck by the disk will yield to the pressure and save itself from decapitation. But over most of the alfalfa territory in the state the soil is too heavy and hard for this. The disk has to be sharp and has to be set at a full angle in order to do really effective work. The alfalfa roots when struck by the sharp disk blade cannot yield to the pressure and are accordingly cut off. Cases have been known where one-third of a stand of alfalfa has been cut up by cultivation with a sharp disk set at a full angle.

THE SPIKE-TOOTH DISK.

Implement dealers within the last few years realizing the need of an efficient implement for cultivating alfalfa have placed upon the market a spike-tooth disk. In general too much cannot be said of the cultivation given to the soil by a spike-tooth disk. On old land that is free from trash, I doubt whether there is any other implement that can do as effective work. But there is a decided objection to the use of the spike-tooth disk in the cultivation of alfalfa. The spikes strike the centre of the alfalfa crown and split the root, rain enters the wound developing root-rot, and then the life of the plant is only a question of time. This same criticism may be urged against the common disk where it is used on light soil and is set nearly straight. It splits the crowns and roots, and paves the way for rot, decay and the death of the plant.

It is urged by some people that this splitting of crowns and roots affords a primary advantage because it is claimed that the impulse of the plant being to reproduce itself before it dies, it will throw out new shoots and begin a more vigorous growth in order to accomplish its purpose. It is a matter of grave doubt among plant pathologists whether this is really the fact. To most of them it seems more probable that this special effort on the part of the plant is expended in a greater development of the shoots already established rather than in the production of new shoots.

THE OPPOSITE VIEW.

One plant pathologist says: "I should as soon expect to increase the number of hairs on a human head by splitting the scalp as to increase the number of shoots on an alfalfa plant by splitting the crown. Each hair springs from a hair follicle and there can be no more hairs that there are follicles. Splitting the scalp will not increase the number of these follicles. Just so the shoots that spring from an alfalfa crown come from inchoate buds or bud germs that are in the crown, the number of which is determined by the inherent nature of the individual plant. These bud germs are arranged in successive generations. This development of one generation proceeds only after the development of the preceding generation has been accomplished. Splitting the alfalfa crown does not increase the number of these bud germs nor advance them from one generation to another. It is probable, however, that wounding the plant produces temporarily a more vigorous growth of the buds already in process of development.

Even if it were true that splitting the crown temporarily increases the growth, it is still of doubtful benefit to do so. As suggested above this gain is secured at the expense of the ultimate vitality of the plant.

A NEW ALFALFA CULTIVATOR.

Within the last two years there has been placed upon the market what seems to me an ideal cultivator for use in alfalfa fields. I desire to call the attention of all alfalfa growers to the work of this implement so that they may make use of it to their own advantage. Of course to name the implement, is to advertise it, to promote its sale, and works to the financial benefit of the manufacturer. I cannot help this. I am working for the benefit of the alfalfa grower and I shall not be stopped in this work by the suggestion that what I may say may ultimately prove of some benefit to some manufacturer. The implement to which I refer is the Deere alfalfa cultivator. It is mounted on wheels and the depth to which it cultivates the ground is controlled by a lever and it may be set so as to give old alfalfa very deep and thorough cultivation and it may be used just as lightly as needed in the cultivation of young alfalfa. The shovels are of such a pattern that they cannot cut or wound alfalfa plants and they have sufficient vibration to enable them to dodge without injury any well established root with which they come in contact. They give the alfalfa as thorough a cultivation as is ordinarily given to corn. They take out all weeds that are shallow-rooted, leaving only those on deep well established tap roots. The shovels are not held rigidly to a certain depth, but are held to their work by a spiral compression spring which will yield on striking any firm obstruction. When used lightly two horses do the work easily for a machine that cuts eight feet in width, but on heavy soil and where thorough, deep work is desired it gives four horses all they want to do.

I cannot speak too highly of this implement both for the manner in which it conserves the growing plants and for the manner in which it increases the growing yield. I do not want to exaggerate, but I think I am entirely within the bounds of a reasonable conservatism when I express the opinion that any farmer in eastern Nebraska who has ten acres of alfalfa and will use this cultivator as suggested will find that the cultivator will pay for itself in increased yield during the first season of its use. This has been a very dry season so far, and, on my own fields I am satisfied that the use of the cultivator increased the yield of the first cutting not less than 20 per cent.—E. W. Hunt, in Twentieth Century Farmer.

Alfalfa in Arctic Regions.

"In addition to corn, potatoes, turnips and many other products America has given to the world, it seems destined possibly to furnish also a more hardy alfalfa. The following letter from a trader relates how a plant, supposedly alfalfa, was accidentally discovered north of the Arctic circle.

During the winter of 1910 I was located at Point Hope, trading for furs and whalebone. As soon as the winds formed opening leads through the ice pack I started in an open whale boat accompanied by my wife, a negro whaleman and three Esquimaux, with my furs and whalebone for Point Blossom, 200 miles south, hoping to catch a schooner which would take us to Nome and thence to Seattle. For 150 miles we encountered nothing but ice, and had to work through the leads, over floes, as best we could, once or twice making shore to prevent being crushed as the wind drove the pack inshore.

It was while we were ashore, about half way between Capes Kruzensterne and Seppings, that my wife while walking around, picking flowers discovered whole acres covered with purple blossoms. Here vegetation grows low, and I concluded these were alfalfa, which instead of growing erect trailed along the ground.

As to how the seed got there, I am of the opinion that they must have been brought by ducks or geese as there are millions of them there during the summer. This date was July 6, and on learning that the government had sent a special agent in quest of alfalfas into Siberia, I wrote the department suggesting they look into this discovery. I am unable to say what has been accomplished in this respect.—F. C. Dean, in N. E. Farmer.

Origin of Grim Alfalfa.

It is of interest to know the origin of Grimm alfalfa, since it is so generally recommended as being the best variety to sow. In northern latitudes this alfalfa has proved to be the hardiest sort, practically without exception. Mr. Angus MacKay, of the Indian Head Experimental Farm, has been doing some co-operative experimental work for the U. S. Department of Agriculture in testing different alfalfa varieties and has found the Grimm to head the list and to be practically unaffected by either spring or winter frosts. As compared with other varieties, Grimm has attained a degree of hardiness not yet reached by any of the others. It has been found that it not only endures low temperatures with or without snow, and with other untoward conditions, but that it can be cut closer and later and it will bear more abuse in the way of pasturage than any other kind thus far grown in comparison with it.

Its name is derived from the man who first grew it in Carver County, Minnesota, Mr. Wendelin Grimm, a German who emigrated from the little village of Kulsheim, Baden, Germany, to Minnesota in 1857. Itis believed that the ori in l seed which he brought with him did not consist of more than 15 or 20 pounds. Mr. Grimm grew this clover continuously and achieved quite a name locally because of the splendid results he secured in feeding it to cattle. He called it everlasting clover. Up until 1899 or 1900 this Grimm alfalfa was scarcely known outside of Carver County. The attention of the U. S. Department of Agriculture was called to the great hardiness and productivity of this particular strain by a neighboring farmer in 1900. Its probable value was immediately recognized and efforts made to extend its culture. For ten years it has led all other varieties in the many tests that have been made to determine its hardiness and usefulness as a forage crop, both in the United States and Canada. Agricultural investigators of note believe that in Grimm alfalfa exists the basis of a successful alfalfa industry in the northern states and the provinces of Canada.

Where to Grow Alfalfa.

Where will alfalfa grow and how should it be started? Alfalfa will grow on any good soil that is well drained; in sand it will not do so well, and hard pan interferes with its root growth. When starting alfalfa it must be kept in mind that alfalfa has bacteria living in nodules on its roots. These germs furnish the plant with nitrogen which they take from the soil air. They put it into the form that the plant can use and so supply the alfalfa with the nitrogen that it needs and more too. The alfalfa plant has in a measure lost the power of taking nitrogen from the soil as the other crops do, so it can

(Continued on page 743.)

HORTICULTURE

Making of a Small Fruit Garden a Necessity.

Every farmer has a vegetable garden. Practically every farm has an apple orchard, while there are cherry trees along the fence rows and pears and plums about the barn and house. Just as these are considered a necessity on every well ordered farm, so a garden of small fruits is considered a necessity wherever the people have become accustomed to the luxury of having an abundance of fruit for daily use.

If we set out an orchard we must wait before it will produce much fruit but we begin to eat of the small fruits the very next season after setting the plants. If we set strawberries this season we may expect a full crop next spring, and of raspberries a partial crop. Currants, raspberries and gooseberries will generally bear full crops the third year if good pfants have been set out.

If there is a warm knoll a few rods from the buildings, says a writer in Greene's Fruit Grower, select it for the fruit garden. The ground should be well drained, that is, water must not lie in it, but it should not be soil which dries out and bakes in warm weather. Land sloping to the south or east is to be preferred for fruit growing when it can be secured. The one location on the farm to avoid is where the soil is cold and wet. Fruits will do no good in such a location. Buds and blossome do not suffer as much from frost on slight elevations as on low grounds, hence we seek such places for our fruit. Lay out the garden in harmony with the buildings and the fields.

Give the ground a good heavy coating of stable manure, plow it under and grow a crop of corn or potatoes. Manure the ground and plow again. It should be cultivated thoroughly, and when dry it is ready to plant. Spring planting is well adapted for all small fruits, and is here recommended.

Plan a garden of a quadrilateral form, much longer than wide. For an acre garden, 400 feet long by 100 feet wide; a half acre, 300 feet by 72 feet, or a quarter acre, 175 by 45 feet. Let the rows be six feet apart and the plants four feet in the row. Having the length of the rows, the number of rows and the distance apart in the row, it is easy to calculate the number of plants of each kind which will be needed. Strawberries may be set fifteen inches apart in the row, the rows being 3 feet apart. If all the plants, except strawberries, are set so that they can be cultivated in two **directions** by the horse it will save much time and labor.

For strawberries only a shallow drill mark is made to indicate the position of the rows. The roots of the plants are carefully spread in a shallow excavation. There is no trouble in securing a good set of these plants if it is remembered that the roots of these plants must never be exposed to air or sun, that the plant must be set at same depth as it stood before moving, and, lastly, that the earth must be thoroughly composted about the roots.

For the other small fruits furrow the land out to a good depth. Drop theplants in the rows at four feet, tramp the plants well into their and with a hoe and the feet cover places. Currants and gooseberries will need to be set deeper than raspberries and blackberries. Buy only first-class plants from reliable dealers. No stable manure should be placed in contact with the roots of bushes at planting time.

Give clean cultivation, just as corn or potatoes need, no more, no less. Do not let a weed grow and keep the ground always stirred until the growing season is over.

After setting strawberries should have all the blossom branches and all the runners pruned away, as they appear until August. This will give good, strong plants. After planting, the raspberries and blackberries cut off all the tops at about a foot above the ground. When the new tops are about four feet high they should be cut off. This will give sturdy plants, able to stand up without stakes. After bearing the old canes are cut out, as they bear but once. The suckers should be cut down as they appear. Currants and gooseberries should have a large portion of the shoots cut out each spring. This will throw all the strength into fewer branches and give finer fruit.

The beginner is advised to plant only such hardy varieties as have been proved of value in his neighborhood, and not to need winter protection. This is true of all small fruits except strawberries, which may be covered with leaves, clean straw or corn fodder after the ground is frozen, in the early winter. The best mulching for all small fruits, except the strawberry, is thorough cultivation, as is given to beets and potatoes.

Danger in Root Pruning.

With the advent of too much rain in the **early summer, quite frequently** the corn plant suffers too close and too deep cultivation,—the plant suffers from root pruning. The reason for this is, because the soil is constantly saturated with water and as a result the corn plant will send its roots nearer to the surface, where the roots can get ventilation and sufficient amount of air for its growth. Should the season happen to be a dry one, then the roots will grow down deeper into the ground.

Should the shovels of the cultivators be set deep into the ground, the roots of the corn plant will be cut thereby their feeding area will be proportionately reduced and the principal source of the food supply of the plant will thus be affected. Should dry season follow when the main lateral roots have been pruned carelessly, the limited root area then can not supply the moisture and the food so necessary for the growth of the plant. Eventually this state of affairs leads to a set-back in the plant or ultimate death.

In order that good cultivation may be done in the field, it is necessary that the cultivators be adjusted in good running order. It is not well to get out in the field to cultivate immediately after the rain, it is better to wait until the soil becomes reasonably dry. Adjust the shovels so that the cultivators run level. Care should be exercised not to cultivate too deep and cover up the plants for that will cripple them. Cultivate deep enough, however, so that the shovels will clear and do good work. In well drained fields and in times of drought, early and deep cultivation is less injurious than when the season is wet.—J. F. W.

The Feeding of the Garden Soil A Necessity.

A variety of plants with a variety of plant food requirements are grown in the gardenf To meet the growing needs of all these different plants many different kinds of fertiliIers must be used on the garden soil. The garden gives large yields in proportion to the area cultivated, and no labor or means should be spar?d to make it yield in abundance.

We like to begin to fertilize our garden soil early in the winter, in fact just as soon as the crops are harvested in the late summer and fall. Small amounts of trash and manure accumulate about the buildings and grounds. These amounts, when raked up and collected, are too small to pay for hitching up to the wagon and hauling to the fields, hence we use the shovel and wheelbarrow and get this stuff on the garden as fast as it is formed. The ashes from our wood stoves are removed at frequent intervals and placed about the

HEADACHES

Were Caused By A Sour Disordered Stomach

Mr. James McLaughlin, Bracebridge, Ont., writes:—"In order to let you know what Milburn's Laxa-Liver Pills have done for me, I am writing you.

"About a year ago I was troubled a great deal with a very sour disordered stomach and had terrible headaches, that were so bad I could scarcely do my work.

"One day in telling a friend who had used your pills before how I felt, she told me to try them, which I did and to my great surprise after using one vial I was greatly relieved, and when the second one was finished I was totally cured, and have not been troubled since with either my stomach or the headaches, and I feel greatly indebted, first to the friend and secondly to Milburn's Laxa-Liver Pills for the great relief I derived from their use."

Price 25c. per vial or 5 vials for $1.00 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto. Ont.

Semi-Steel Fire-Pot—Not Gray Iron

A FIRE-POT of a furnace should be able to endure tremendous heat and to repel the attacks of sulphur fumes.

The material commonly used for a fire-pot is gray iron. The Sunshine fire-pot is *Semi-Steel.*

Now, avoiding technical terms, gray iron has what may be called "open" pores. Through these "open" pores the destructive sulphur fumes attack the iron and hasten disintegration.

On the other hand, Semi-Steel is a close-grained material, with a smooth-as-glass surface which practically seals or "closes" up the pores. Semi-Steel easily repels the attacks of gas fumes and thus greatly prolongs the life of the fire-pot.

A Semi-Steel fire-pot weighs 20 per cent. heavier than the same size and pattern in gray iron. It is therefore better able to endure tremendous heat.

Semi-Steel is made by an *exclusive* McClary process. You can only get a Semi-Steel fire-pot with a McClary furnace. That is one strong reason why you should have the Sunshine installed in your home. Our agent in your locality will tell you many other reasons. Ask him.

Remember, the Sunshine is *guaranteed,* by the largest makers of furnaces in British Empire, to heat your home to your entire satisfaction. 45

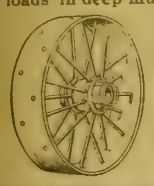
Haul Bigger Loads Without Tiring Horses

The money you spend for a T-K Handy Farm Wagon is just as safe as if you spent it for a government bond. You are sure of the returns, for this wagon will carry greater loads without tiring the horses and is so easy to load and unload that only one man is necessary to do the work.

T-K Handy Farm Wagons and Wide Tire Steel Wheels

Fit all your farm wagons with these wide-tire steel wheels. You can haul heavier loads in deep mud or on the rockiest road without accident or delays. Besides they lessen the wear and tear on all farm wagons usually due to wooden wheels.



Write for catalog telling how T-K wagons and wheels save and make money for you.

Soreness of the muscles, whether induced by violent exercise or injury, is quickly relieved by the free application of Chamberlain's Liniment. This liniment is equally valuable for muscular rheumatism, and always affords quick relief. Sold by all dealers.

base of the grapevines, bush fruits and larger fruit trees. The winter and spring rains leach out the easily soluble potash and other mineral elements of the ashes and carry them to the roots of the fruit trees, bushes and vines for early feeding when spring growth begins. Wash watet and other soapy slops are poured on the vegetable garden, the small fruit patch and on the flower beds. It is true these slops do not contain large amounts of fertilizing elements, but they must be disposed of in some way, and it is better to save them for fertilizing food and flower crops than to throw them out in the back yard anywhere, or to allow them ta run away through the underground drain pipe. The dirt and waste about the dwelling can be utilized in the garden soil better than in any other way, and in a few years the fertilization amounts eo considerable. About twice each week the cow lot is cleaned with the rake and shovel, and the crapings, amounting to some half a dozen wheelbarrow loads, are removed to the graden and dumped in piles. By spring gardening time these small piles are decomposed and in fine condition for working into the soil, either for the vegetable or for the flower beds. Cow manure is mild and safe to use with the tenderest of plants, as very little heat is given off in decomposition. That which has remained in small heaps over winter in the garden works up in spring as fine as the finest garden loam, and is one of the best all around garden fertilizers that can be used.

The droppings from the poultry houses are cleaned out regularly during the winter and either applied direct to the garden soil or mixed with stable manure and applied with it. As poultry manure is very strong, it should be applied thinly over the surface. A little of it will go a long way. Where coal ashes or other similar absorbing material is used with the droppings there is less danger of overfertilizing the soil with them. The ashes absorb and hold fertilizing elements, and when they are worked into the soil they give up these fertilizers as plant foods and at the same time improve the texture of the soil, making it light, friable and easy to Absorbing material should always be used with poultry droppings, since it keeps the poultry house more sanitary and almost doubles the value of the manure.

Where not enough refuse about the home can be had to properly fertilize the garden during the winter we use the manure from any of the animal stables. In spring all the coarsest portions is raked off and hauled to the fields.

Success with Rhubarb.

The three or four inch coat of manure which I have spread all over the rhubarb-patch in early spring this year has had its effect. Although we have had no rain for a long time, and the land is dry everywhere, the rhubarb has grown, and is growing wonderfully. The stalks are fatter than ever, and more of them. The demand keeps up. People evidently learn to use rhubarb more and more, not only for pie-material, but also for sauce. The quality of our rhubarb, owing to its rapid growth and brittleness, is exceptionally fine. Some persons com@ented on its "strawberry-like flavor." Be that as it may, the rhubarb-crop has been very profitable these many years, and it seems to continue to be profitable. So easily grown, too. But it takes manure and good, warm land.—Farm and Home.

DO IT NOW.

When a man ain't got a spray pump, and is feeling kind of down,
And the pesky little insects won't let his crops alone,
It's a great thing, oh, my brethern, for a fellow just to say
Send and get a "Perfect" spray pump, and apply a coat of spray.

It makes a man feel queerish when the season's work is through,
And the taties are all rotten and the apples wormy too,
Then order up a "Perfect" and do it right away,
And spray the fruit and taties and save them while you may.

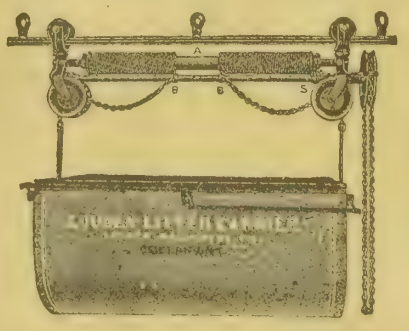
LOUDEN'S TUBULAR STEEL STALLS AND STANCHIONS.



Your dairy cows deserve the cleanest and most comfortable surroundings that they can have.

LOUDEN'S Stalls and Stanchions are being used by an increasingly large number of farmers who know. There's a reason. They are easily fitted in a stable, easy to keep clean, perfectly sanitary, positively germ proof, and will last a lifetime.

Full information regarding plans, estimates, etc., cheerfully furnished.

Louden Machinery Co., Guelph.

A Free Catalogue for the Asking.

How the Matchless

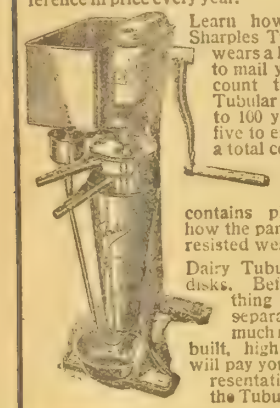
SHARPLES

Tubular Cream Separator

Proved it

WEARS A LIFETIME

Were you thinking of buying some other separator to save a little in price? We tell you positively that the Tubular has twice the skimming force of others and therefore skims twice as clean. The Tubular more than pays back the difference in price every year.



Learn how the matchless Sharples Tubular proved it wears a lifetime. Ask us to mail you, free, the account telling how the Tubular did work equal to 100 years' service in a five to eight cow dairy, at a total cost of one dollar and fifteen cents for repairs and oil. The account contains pictures showing how the parts of the Tubular resisted wear.

Dairy Tubulars contain no disks. Before risking anything on any inferior separator, see how much more the properly built, high quality Tubular will pay you. Our local representative will show you the Tubular. If you do not know him, ask us his name.

Write for catalogue No. 194.

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H 309, Windsor, Ont.

DAIRYING.

Boarders vs. Boarders.

If some one should come to our house and board off of us for two months and not pay any board, we would consider it an outrage and naturally feel quite indignant, and right we should. It would mean a clear loss to us of from $10 to $20 and with the high cost of living few of us can lose that much. But still we keep other boarders on the farm the year round who never pay us anything and we never think anything about it. These boarders are in disguise as milk cows and are often kept for several years at an actual loss.

By careful investigations it has been found that fully one-third of the cows of the state are kept at a loss of from $10 to $20 a head per year.

With conditions such as these it means that the farmer who keeps cows may have a few boarders if he isn't careful and doesn't know exactly what each cow is doing. With the high cost of production of dairy products it is now time that these boarders were discovered and kicked out as we would do our wife's poor relation.—Ernest Anthony in the Missouri Agricultural College Farmer.

Prevent Mold on Butter.

With the advent of the warm weather we shall soon begin to hear from the trade about moldy butter unless creameries start out to fight that enemy "mold" in a determined and systematic manner. It is a well-known fact that mold-infected butter becomes unsaleable in a comparatively short time and involves not only heavy financial losses and unpleasant business relations, but also a serious loss of prestige and standing on the market of the person or firm who make and sell such butter.

Science tells us that mold is a plant, though of a very low order. Like other plants, it grows from seed, called spores. Mold spores abound in the air and around us, and given favorable conditions and a suitable medium they will settle and grow. Dampness, bad ventilation, medium temperatures, and absence of light favor the growth of mold, but the opposite conditions retard or even stop its growth.

Dryness, good ventilation and light in any workroom add greatly to the comfort and pleasure of the workers, so there should be no need of specially urging anyone to apply these conditions in creamery work for the purpose mere of preventing the growth of mold. These conditions should also be provided in the places used for storing supplies such as salt, packages, parchment paper, etc. The use of lime for whitewashing walls and ceilings and for scrubbing wooden utensils and floors will be found very helpful in keeping the creamery and utensils in a sanitary condition, free from mold.

High temperatures to control mold may be employed in the form of boiling water with or without the addition of lime or washing soda for the final scalding of floors and utensils, and also in the daily re-boiling of the brine in which the parchment liners and print wrappers are prepared. —C. L. Marker, Dairy Commissioner, Alberta.

The Dairy Calf's Inheritance.

The large amount of capital invested in milch cows should return a fair rate of interest. This and much more is possible with the splendid opportunities offered to farmers and breeders to raise and sell at good prices high grade dairy cows and at the same time produce large quantities of milk, butter and cheese. Success along this line for a period of years demands that we grasp every idea that will help us increase the number and improve the quality of our dairy calves.

It is folly to attempt to raise a malformed, runty, sickly calf. Dispose of this kind in the best way possible. Start with a healthy, vigorous calf of the desired type and conformation. See that it has good size a dairy type and well placed teats. It is said that the vigor and digestive powers of the calf are frequently indicated by the teeth at birth, of which there should be six or eight well pushed through. This indicates that the mother had sufficient vitality and was sufficiently nourished to perfect the calf before birth.

The future of the dairy cow depends largely upon the treatment she receives as a calf. She may be made or unmade in the first fifteen months of her life and the effect of generations of good breeding may be annihilated because of poor and insufficient feed, care and environment. It takes intellect and skill to grow and develop a calf into a dairy cow capable of producing 300, 400, or 500 pounds of butterfat per annum. The cow's product is a good index of the amount of intelligence that somebody has put into her.

The dairy calf has an inherent claim to be well born. It is her birthright. It should have had the privilege of descending from parents with a good or excellent record for dairy production. Its ancestors should have been bred along a definite line for a definite end.

Its sire should be a good, pure bred dairy bull, selected because of his ability or expected ability to stamp his qualities upon his offspring. If he is a mature bull so much the better. No farmer or breeder can afford to own a poor sire.

The dam should be as well bred as possible, commensurate with the owner's capital and experience. Under all circumstances the dam should be well nourished. A man that will partially starve a pregnant cow is devoid of good cow sense. Starvation may result not only from giving insufficient feed but in giving feed of a wrong character. A cow kept excessively fat on corn stover and corn meal may still be starving the calf.—D. H. Otis.

Dairy Notes.

Stop churning when the butter globules are about the size of wheat kernels.

If milkers would just remember how painful a sore finger is when squeezed, they would not blame the cow with sore teats for kicking the pail over. A little vaseline rubbed on after each milking is good.

The modern dairyman who tests his cows with the scales and the Babcock tester is only applying the old Biblical rule of "by their fruits ye shall know them." The old standard is not likely to be superseded with anything better yet for a while.

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learned that in the

Frictionless Empire

Empire Line

Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Farmer Agents Wanted in Unrepresented Districts.

IF YOU ARE A FARMER

this letter will show you the way to make money in your leisure hours—and a means of keeping the boys at home by giving them a business of their own.

Wm. Keithley, of Superior, writes about

"IDEAL" FACE DOWN CONCRETE BLOCK MACHINES

"Bought an Ideal when business was at low ebb—not enough to keep one man busy. Very soon, I was rushed with Ideal work. This year, made and sold more material than two red brick yards and two cement competitors. Money comes in hand over fist".

You can do it too. Make concrete blocks for houses, barns, silos, foundations, fences, etc.—take contracts for Ideal Concrete Blocks in place of brick or stone. There's money in it.

Our book explains everything. Write for free copy.

IDEAL CONCRETE MACHINERY CO. LIMITED
Dept. M, LONDON, Ont.

"Reliable and Energetic Agents Wanted in Every Locality."

MUMFORD BROS.

PRODUCE COMMISSION MERCHANTS
MUMFORD'S BUILDING, ARGYLE ST.,
Halifax, N. S.

Personal attention given to sales of Butter Eggs Hogs Beef, Poultry, Fruit, Vegetables etc., Consignments solicited. Proceeds of sale remitted promptly, Halifax prices sent on application TELEPHONE 1005

It will pay you to start your letter with the words: "I saw your advertisement in The Maritime Farmer."

Dr Morse's Indian Root Pills positively cure Constipation and all Kindred & resulting troubles. 25¢ a box. 16

Minard's Liniment Co., Limited.

Dear Sirs,—This fall I got thrown on a fence and hurt my chest very bad, so I could not work and it hurt me to breathe. I tried all kinds of Liniments and they did me no good.

One bottle of MINARD'S LINIMENT, warmed on flannels and applied on my breast, cured me completely.

C. H. COSSABOOM.
Rossway, Digby Co., N. S.

Cause of Poor Milk.

A week does not pass in which we do not receive a number of enquiries in which is asked the cause of poor milk—that is, milk which has objectionable odors and flavors. Among the number of causes the following may be enumerated:

IMPROPER FEED.

Garlic, wild onions, certain weeds which are common in some pastures, musty hay, straw, fodder or grain, decayed silage, all cause objectionable odors to the milk. It is claimed by some that even properly preserved silage will cause the milk to taste some time when it is first fed to the cows. Too much of any one kind of feed, such as corn, barley or corn fodder, will cause flavors that may be considered objectionable to those who were not used to them.

DIRTY DRINKING WATER.

It is admitted by a large number of dairy authorities that the dirty drinking water will cause objectionable flavors. Water from pools and ponds, especially when the supply has run so low that the water is dirty and smells, will contaminate the milk with odors that are objectionable, if not dangerous to the health of the consumer. Dirty water used in washing the dairy utensils is a source of a great deal of contamination and, consequently, detrimental odors.

FOUL AIR.

One of the prime sources of odors and flavors in milk is in the impure air in the cow stables. While the milk is being drawn the organisms which cause these odors enter the milk and mulptply rapidly till they produce the flavors if not the odors.

LACK OF CLEANLINESS.

This is one of the principal causes of these troubles. From the time the milk is drawn till the cream is skimmed there is a continuation of opportunities for impurities to enter the milk. If the udder is allowed to crust over with filth it can be seen that a large amount of the filth will fall into the pail when the milk is being drawn. If the hands are covered with even a limited amount of dirt much of the dirt will drop into the milk. If the pail is not clean or the utensils in the dairy house are only partially clean, or if the dairy room is not clean and the air is filled with odors from filth, decaying vegetables or improperly fermented milk, the fresh milk will become contaminated with objectionable odors.

DISEASED ANIMALS.

If the cow is suffering from any derangement of the system, especially any trouble that affects or is seated in the udder, the milk will possess flavors and odors which are both objectionable to the taste and smell and are decidedly injurious to the health of the consumer.

PREVENTING THE TROUBLES.

The proper way to prevent odors and flavors is to feed pure and wholesome feed, give the cow nothing but pure water from deep wells, see that the barn is clean and the ventilation perfect, keep the utensils clean and weed out all the diseased animals from the herd.

Hard Milkers.

It is pretty well understood by practical owners of cattle that it is a difficult matter to own a herd of any size without having in it a hard milking cow. A hard milking cow usually possesses this ailment or blemish at the time of giving birth, and unless she is interfered with she will carry it through life.

On the other hand, cows oftentimes develop into hard milkers owing to the fact that the little milk ducts at the point of the teat become infected by coming in contact with the floors or manure that they lie on.

Perhaps the first symptom of infection appears in the form of a small scab at the point of the teat which prevents the flow of milk entirely, until it is removed. After being removed the sore is then exposed and liable to reinfection, often times causing the complete loss of a teat, but if the teat recovers and the wound heals, the sphincter or milk duct becomes so contracted as to cause milking a difficult task. The cow is then termed a hard milker.

Many a valuable cow has been disposed of at a very low price owing to the fact that she is a hard milker and it seems strange that cows thus afflicted, regardless of the quantity and quality of milk they produce, are very apt to be disposed of on account of this difficult task which has to be performed twice daily. I dare say that a large majority of hard milking cows have been disposed of by bright and intelligent owners owing to the fact that they do not know what course to pursue in overcoming the difficulty, may believe that nothing could be done to overcome it, consequently this sacrifice would be made.

Many experienced stock owners have made a business of buying hard milking cows at a sacrifice and by proper treatment have converted them into easy milkers, thereby in many instances greatly increasing the animal's value.

Organism that Sour Milk.

A pamphlet by W. M. Esten, bacteriologist of the Connecticut Agricultural College, describes the discovery of the origin of the organism that sours milk. Of all fermentations of milk the lactic acid one is the most desirable. The most important phases of its work are: Natural souring of milk and cream; controlling ripening of cream and initial stages in the ripening of cheese. Milk soured by this organism is not injured, but rather improved as an article of food. It is very rare to get milk from a herd or even a single cow that does not contain this organism.

The history of the discovery of this organism as an agent in souring milk commenced in 1877, when Lister isolated it from sour milk. Since that date a large variety of milk souring organisms have been isolated by different investigators. The results of these i nvestigations indicate that two types of organisms have been isolated; the first a true bacterium which ferments milk sugar with the formation of C O 2; the second type a streptococcus or bacterium which ferments milk sugar to a pure lactic acid with no gas formation. The investigation further indicates that the first type is not the ideal milk souring organism, but is accessory and the cause of abnormal milk fermentations. The second type is represented by evidently two forms, a typical streptococcus and a more or less questionable bacterium form which appear to differ only in morphology. Opinions are divided and the problem is under debate.

WINDSOR DAIRY SALT

The wise housewife knows the importance of always keeping a good supply of Windsor Dairy Salt on hand.

She knows that Windsor Salt makes the best butter—and she is not satisfied to make any other.

Windsor Dairy Salt is both a money-maker and a money-saver.

It makes money for farmers and dairymen because it makes butter that brings the best prices.

It saves money for them because, being absolutely pure, it requires less to properly salt the butter.

39

Dairy and Creamery Butter.

Please tell me what the difference is between first-class dairy butter, the best that can be made, using separator, butter worker, etc., and the best creamery butter that is made in a large creamery. Why doesn't dairy butter keep as well as creamery butter and why is it not equally as good in every way?

Ans.—In answer to the above question I would state there should be very little, if any, difference between first-class dairy butter and first-class creamery butter where all of the modern equipment is used. As a matter of fact, dairy butter should be better, if anything, than creamery butter, as the men have complete control of all surroundings in the production of the milk and of the cream. However, at this point comes in the butter maker, who is in reality one of the largest factors in butter making.

Dairy butter is oftentimes made for a quick market, is not washed properly, and is not salted as heavily as creamery butter. The leaving of a small amount of buttermilk in the butter will cause it to deteriorate after a very short time.

Butter when first made may be classed as a first-class article, but does not have the keeping qualities of the properly washed and properly salted butter. The information included in the question is very vague, consequently, I am unable to answer further.—Prof. Lockwood in N. E. Farmer.

When the stomach fails to perform its functions, the bowels become deranged, the liver and the kidneys congest?d causing numerous diseases. The stomach and liver must be restored to a healthy condition and Chamberlain's Stomach and Liver Tablets can be depended upon to do it. Easy to take and most effective. Sold by all dealers.

LIVE STOCK

Impaction of the Rumen (Plenalvia)

Impaction of the rumen—technically plenalvia, and known popularly as "grain sick," or "maw-bound"—arises from engorgement of the first stomach by solid matter, taken in hurriedly in such amount as to paralyse the organ from aver-distension, and generally the impacting material is some kind of food of which the animal is particularly fond, or of which it has been for a long time deprived. Impaction of the rumen with food is not nearly so common as distension of the organ with gas—termed "hoven," or "blown"— but it is a pathological condition similar to it, though differing in the urgency of its symptoms and in the treatment it requires. It is quite as much a preventable condition as "hoven," since no animal should be allowed food in sufficient quantities to produce it, and unless cows accidentally gain access to food stores, or from open gates or defective fences get among crops from which they should have been excluded, its occurrence is quite without excuse.

Over-distension of a hollow muscle causes it to become practically paralysed and in the case of the rumen its muscular coat is not sufficiently powerful to contract on its contents, so that movement of the solid mass and digestion altogether cease. Most people who have seen a bullock slaughtered will have some idea of the enormous capacity of the adult rumen, or "maw", and know that, even after the animal has been fasted for several hours before being killed, it contains many gallons, but only those who have seen the operation for the removal of its contents when dangerously impacted will be able to form any idea of the amount of solid matter it will hold, and the degree of distension to which its muscular coats can be subjected. Almost any food that the animal appreciates may give rise to it, although with some exceptionally greedy feeders it may arise from an limited supply of such common fare as hay, but by far the most dangerous cases are those in which grain—especially wheat—is the impacting material. There is a kind of chronic distension arising from loss of cud, and feeding cut meat with cake and meals, but this is another story, and differs considerably from the rapid engorgement we have under consideration

The primary symptom, or rather the initial stage of impaction of the rumen is not characterized by the amount of pain and uneasiness present when gas is the distending agent, but, although there is less urgency, the disorder is one that will admit of no time being wasted before measures are taken to relieve it, or alvitis—inflammation of the rumen—will be set up, and the case terminate fatally. There is a swelling on the left side, visible in the same position as in "hoven," but if pressed upon with the fingers it is a matter of very little difficulty for even the inexperienced to distinguish between the soft mass which is present in animals suffering from impaction and the gaseous distension existing in the case of animals suffering from "hoven." On pressing the swelling with the fingers it "pits," leaving the impress of them for some time, and there is an entire absence of the resonant drum-like sound of tympany. In time this may, however, occur as a complication, for the impacted mass being immovable, the cud lost, and the organ paralyzed, fermentation is set up and gas eliminated. Then the breathing becomes affected, and the animal stands with the back arched, the head protruded, grinding its teeth. Movement is attended with pain, and when forced to change its position the moans and groans of the animal are eloquent of this. Generally it stands obstinately, or, if the recumbent position is assumed for a short time, the cow goes down very carefully, and lies on the right side, in order to avoid the pain associated with pressure on the distended stomach. If no relief is obtained, inflammation sets in, the temperature is raised, general febrile symptoms manifest themselves, and there is evidence of acute pain. Constipation is present throughout a small quantity of hard glazed faeces being passed at first, but during the last stages nothing whatever is voided.

Treatment is by no means a simple matter, and the really bad case of impaction of the rumen generally dies unless there is operative interference. To get the bowels to act freely, to soften the impacting mass, and restore tone to the stomach is the end to be obtained. Purgatives and stimulants are, therefore, indicated, but dependence must not be placed entirley on Epsom salts, for, valuable medicine as it is, it acts mainly on the back bowels, and what is wanted is to involve the stomachs in the catharsis. Aloes, gamboge, croton, and other drastics are therefore given, but they are suitable only in the early stage and when inflammation has set in they must not be given. An example of an early drench is: Barbadoes aloes, 1 oz.; carbonate of ammonia and powdered ginger, of each ½ oz.; Epsom salt, 1lb. This should be given largely diluted with warm gruel, after which it is generally best for the owner to depend entirely on linseed oil. A quart should be given two hours after the drench, and repeated in does of a pint, with the ammonia and ginger dissolved in warm ale or gruel every six hours, or until an effect on the bowels is produced. Linseed oil acts mechanically by softening the impacting mass, and to assist in this the region of the stomach should be massaged with the hands or a mild stimulating liniment. A mild case—that is, one in which the engorgement is not excessive—will generally yield to this treatment, but when it does not do so quickly, or in severe cases where the distension is enormous, as sometimes happens where cattle get at wheat, barley or brewers' grains, then resort must be had to the operation called rumenotomy or "pauching." It is of no use, however, waiting until the animal is in extremis before this is decided upon, for when the strength has become exhausted by long suffering, the brain has become affected, or alvitis set up, the chances of success are, of course, materially reduced, and it is idle to blame the veterinary surgeon if it fails.—Pateley Bridge.

Let the Pigs have Exercise

Exercise is cheap on the farm but it is a very valuable thing for pigs. In fact young pigs can't get along without it, and older hogs will soon go wrong if confined in close quarters continuously. The first essential in successful pig raising is, perhaps, to get the sows through the winter right and the next is most certainly the proper care of the pigs when they come. It doesn't cost much to enclose a pasture area for the brood sows and pigs. This involves some work, of course, but so does plowing. Most everything we do is work, for that matter, but it is work that keeps the world going, and the most of us would not have three meals a day, clothes to wear and a bed to sleep in if some one were not put to work. But that is a little aside from the subject of exercise for pigs.

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent use of my great appliance, for it gives, in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back; from the first hour's use you experience a decided benefit; there is a great mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; woman and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfect manhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Let Me send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

CALL If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice, either at my office or by mail. They are better than a fortune for any one who needs new vigor.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment ; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Agents Wanted !

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Steel Ladder.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co.,
Sussex, N. B.

Chamberlain's Stomach and Liver Tablets gently stimulate the liver and bowels to expel poisonous matter, cleanse the system, cure constipation and sick headache. Sold by all dealers.

With a good green pasture in which to run, good milking dams, and feed where they can get at it alone as soon as they wil, take it, good and rapid gains should be made. Pigs that have plenty of exercise do not have thumps, they don't have scours and they don't have a lot of other things. But they do have good health and an appetite that will make pork out of almost anything.

Feeding Whey to Swine.

We farmers do not appreciate to the full the feeding value of whey; this is evident from the fact that at cheese factories all over the country each year large quantities of whey are drained off into the neighboring streams. When we come to consider that when properly used whey has a feeding value of 10c. a cwt., the loss of this by-product is a serious consideration to the patrons. An effort is being made in some cheese factories to get something out of the whey by skimming it and manufacturing whey butter. Even when the butter fat is removed, the skimmed whey is very little depleted in feeding value.

An important point in feeding whey is that it be kept sweet. When hogs are fed with whey from a clean tank and when the whey is left in the tank a few days and gets old, it will not be eaten by the hogs until hunger compels them to. The sweetness of the whey is particularly important when fed to brood sows with litters or to very young pigs.

Experiments conducted at the Wisconsin Experiment Station show that hogs fed on middlings and whey made rapid and economical gains. In the first of the series of experiments, the hogs were fed 35 lbs. of middlings in 100 lbs. of whey, and were not on pasture. When about nine months old they weighed from 240 to 250 lbs. a-piece. In the next experiment hogs were on pasture and only 10 per cent. of the middlings was added to the whey. The pigs drank about the same amount of whey as the pigs in the pen and made the same gain on 25 per cent. less middlings. Both of these lots of pigs did much better than pigs that were carried on at the same time on water in place of whey.

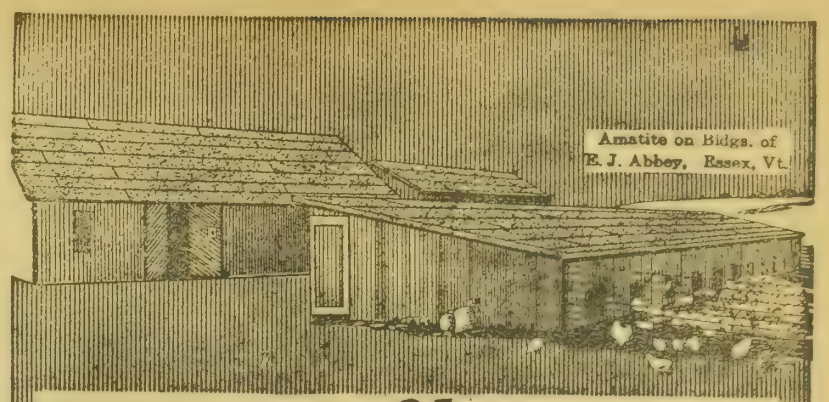
These experiments show the feeding value of whey; also of good pasture for hogs. During the finishing period the hogs were confined in pens and the proportion of middlings was increased.

Dehorning Cattle.

We wish every farmer in the land could read what we are writing. It would, so far as farmers are humane and wise, save a vast amount of suffering and no little money. Leaving out of the account the whole question of cruelty in the dehorning process and the reasons assigned for depriving the cattle of these weapons of attack and defence, admitting the greater docility of the individual animal and the herd when hornless, why wait till dehorning must be done by methods that cause pain and involve expense?

In Ireland for a long time the requirement has been enforced, if we remember rightly, by law, that the growth of the horn be stopped in the calf. This is the simple operation : Take the calf at any time under two weeks of age, better under one week, mositen the slight bunches on the head where the horns are to grow with a little water, then rub these spots with a pencil of nitrate of silver, not breaking the skin but just ittitating it till it becomes red. The calf will scarcely mind the sensation though it may shake its head occasionally for a few minutes. It will never develop any horns.

We have tried this experiment personally on a large number of calves, seen them drink immediately after it as if nothing had happened and watched them grow up hornless cattle. Any one who has witnessed the dehorning of mature animals cannot imagine a farmer or a dairyman ever permitting his young stock to be neglected till it becomes necessary to subject them to such an ordeal, when at no expense and in so painless a way the development of the horn may be stopped at its very beginning.—F. H. R., in Our Dumb Animal.



Amatite ROOFING
Needs No Painting

TRADE B MARK

AMATITE *roofing is weaned.* It doesn't need to be watched over and fussed with and cared for.

It takes care of itself from the start. As soon as it is laid on your roof, you can go away and forget about it.

You *don't have to paint* Amatite every two years as you do the "rubber" kinds. Amatite has a mineral surface which needs no painting.

The mineral surface is better and more durable than many coats of paint.

Back of the mineral surface is a layer of pitch, the greatest waterproofing compound known. Back of the pitch is a layer of felt (a whole ready roofing in itself), and behind this is another layer of pitch and another layer of felt. The result is a strong, durable roof which can take care of itself in any climate without painting.

We will be glad to send you free a sample of Amatite Roofing so that you can see for yourself just what it looks like. Address our nearest office.

Everjet Elastic Paint
Low in price. Great in durability. Invaluable for prolonging the life of ready roofings, fences, iron work, etc.

Creonoid Lice Destroyer and Cow Spray
It will keep flies away from the cows. It will keep lice and nits away from the poultry, make everything sanitary and increase their output.

The Carritte-Paterson Mfg. Co. Limited

St. John, N. B. Halifax, N. S.

Good Care for the Herd Bull

In most districts the heaviest of the breeding season comes during the summer months, and it is then that the stock bull needs the best of care and attention. It is also at this time of year that he is likely to have the least time spent in keeping him clean and well exercised, and his quarters in a sanitary condition. Very few breeders allow the bull to run on pasture with the cows, because there is a danger of all the young heifers getting with calf, and thus having their growth impaired. The bull is much better kept away from the cows even if no heifers are pasturing with them, because he harms himself, as well as being a source of annoyance to the cows.

Most bulls are kept in the stable during summer, many in loose stalls, and many others tied. This gives rise to the problem of how to keep the bull exercised sufficiently to maintain him in the best possible breeding condition. The loose box is a great advantage over the tie, but even it does not give sufficient exercise and some further provision must be made to give the herd header a chance to move around and to keep in an active and useful condition. Wherever a bull is kept, a grass paddock near his stable is a great benefit, and should be provided if possible. A little alfalfa, red clover and corn, growing near the buildings and fed as a soiling crop, is also very profitable, since green feed is necessary, and a variety of this goes a long distance toward keeping the bull in a thriving condition. A little concentrate material is usually required, and can be well supplied by the feeding of a little oat chop, with a small quantity of bran or perhaps also a little heavier chop, as barley, peas, etc. It is not advisable to overfeed with these, but it is important that the bull be kept up in good flesh.

As the hot weather approaches, and the flies become troublesome, the bull should be out in the paddock during the nights, as he will then be able to eat and take his exercise without being troubled with these pests. During the day, the windows of his stall or stable should be darkened, as this is also a very effective means of preventing the trouble caused by the swarming of these insects around and in the bull's stall, causing him no end of discomfort. Cleanliness in the stall is another means of preventing the fly trouble. Owing to press of work in the summer season,, the stable is often left uncleaned for days at a time, or, if it be a box stall, often for weeks, and even for months. This is detrimental to the bull's general health and serves, also, as a breeding place for the filth-loving fly, which increases rapidly under such favorable conditions.

—Farmers' Advocate.

THE HORSE.

Distemper in Horses.

Distemper is a disease peculiar to the horse, and it is likely that it will be affected with it sometime, It is therefore called "colt ill." It is contagious and can be carried on the clothes of a person from one barn to another. It may break out in a stable and no other cases in the neighborhood. The contagion may have been brought in some unknown way.

There are signs of catarrh, the animal is dull, has a cough, and when it swallows, makes a peculiar sound in its throat. There is soreness in the throat and some of the water it may be drinking will come back through its nose; the head is poked out, a little frothy saliva exudes from its mouth, sooner or later a swelling will appear at the back of the jaw; when this takes place the animal has great difficulty in swallowing water and food especially the former. In some cases there is very little fever and the appetite remains good. In others there may be considerable fever, pulse sixty to seventy. In the course of a few days the inflammation in the lumps relieves itself in the formation of matter, which will soon come to the surface and the lumps break of their own accord if not opened. After this takes place the animal is much relieved. Cases may be met with where a small abscess may form and the animal may show no other symptoms; this soon breaks, discharges and heals. In others, although not very sick, the condition of ill health may continue for several weeks, and finally an abscess appears, matures and the animal soon recovers. Again, others may swell on the inside of the throat and suffer great distress and may suffocate.

Irregular strangles is where abcesses form in other parts of the body, such as on the shoulders, hips, flanks, side of the neck, or back of the elbow; also in the liver, between the lungs, or in other parts. So long as the abcess forms on the outside it is not dangerous to life, but those on the internal organs usually cause death.

The sequel of distemper most frequently occurring is a thickening of the lining of the throat, which interferes with the animal's breathing, causing what is called roaring or whistling. The more serious sequel is blood poison from the absorption of matter from the abcesses forming on the internal organs. About the ninth or tenth day the animal ought to begin to improve. On the other hand, if at that time the fever is increased, appetite lost, and the temperature one hundred and five to one hundred and six, there is occasion for alarm, as it indicates that something is going wrong inwardly.

In the early stages of distemper put the animal in a warm, well-ventilated stable. Clothe the body and bandage the legs. If the throat is sore put a piece of camphor gum into a pail of boiling water and put it under the animal's head (but not near enough to scald), and throw a blanket loosely over it to keep in the steam; continue this for fifteen or twenty minutes and repeat it three times a day. Dissolve two drams chloraee of potassium in half a pint of cold water and put in one teaspoonful of the fluid extract of belladonna. Shake up and gargle the throat. This is best done by holding the head a little above the level and pouring a little into the mouth; rubbing the tongue to make the animal move it. If the animal coughs, let the head down at once, and after it ceases coughing hold the head up and pour in a little more, and so on until it is all used; do this three times a day.

If there is any fever give half an ounce of nitrate of potassium in its drinking water once a day. Physic should not be given. If the bowels are confined give injections of soap and warm water. If an abcess forms, poultice it with a warm linseed poultice, changing the poultice once a day. When the abcess becomes soft, open it and inject a little lotion made of carbolic acid, half an ounce water, one pint. Poultice for a few days after it breaks to soften the surrounding parts so that there will be no bunch left after it heals. After the acute stage has passed mix and divide into twenty-four doses, four ounces sulphate of iron, four ounces nitrate of potassium, and two ounces nux vomica, one to be given twice a day in bran mash mixed with a little oats.

If there should be a great discharge of matter from the nose after the animal is convalescent, put one ounce oil of turpentine into a pail of boiling water and put it under the head as above, not near enough to scald; do this several times a day. If the abcess is tardy in forming mix two drams cantharides and one and one-half ounces of vaseline and rub on a little once a week. If the glands of the neck should remain enlarged after the animal has recovered, rub on a little of the following; mix one dram biniodide of mercury with one and one-half ounces of lard. Repeat every second wek. If abcesses form on other parts of the body they should be treated as above.

If the animal's appetite is poor, give one ounce each of tincture of ginger, gentian and chlorite of iron in a quart of oatmeal gruel three times a day. Give half this quantity to colts a year old. Give the animal small quantities of food at a time and often, as it will eat a little fresh hay or oats when it would refuse to eat that which was in the manger.

The Mare and Colt.

What shall we do with the colt while the mother is at work on the farm? It is best to keep him in a box stall in the barn or in the shaded grove or orchard while the mare is at work. Wearily plodding after the mare across ploughed ground in the heat of the sun tires the foal and is trying to the nerves of the driver.

If the mare must be worked before the foal is a month old, it is best to come in once in the middle of each half day to give the mare a pail of water and the colt a chance to get a lunch. After he is a month old and learns to eat oats and bran a little can be placed where he can help himself and he will pass the time eating and will never get hungry or miss his mother. The best success is obtained weaning our colts at four or five months old where the mare has to work regularly. By feeding skim-milk as a side dish with their oats and bran the colts never miss their mothers. They should have an opportunity, however, for exercise and it is best to have two or more run together. The colts will seldom eat more oats and bran than needed when they have the run of a pasture or are fed plenty of clover hay. It costs something to feed a colt as it should be fed, and this is a good reason for not throwing away feed on an inferior colt that barely pays for growing and returns no profit.

Teaching to Stand.

Saddle horses and others are sometimes taught to stand whenever the reins are thrown over their heads. This is done by fastening a sack to the reins so that whenever the horse walks forward it steps on the sack and gives itself a jerk in the mouth; very soon he learns that whenever the sack is left there, he is to stand; and after a while the sack is removed and he still knows that he is to stand. Should he, however, then disobey, the sack must be again tied on. Some horses can be taught this without using the sack, especially if the reins are long ones like those used in Alberta, etc., on stock ponie).—Canadian Farmer.

Horsemen Attention!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as, Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING.

CURES:
SPLINTS,
CURBS,
SPAVINS,
ENLARGEMENTS,
COUGHS,
COLDS,
DISTEMPER,
GLANDERS,
FOUNDER.

AFTER USING.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended, Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on its merits, you will be compelled to endorse it.

TESTIMONIALS:

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and became so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it,

Very truly,
RODERICK McKENZIE.
Hillsboro, N. S

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contraction of the hoof.

POULTRY.

How Easily Eggs are Tainted.

It is a theory long since proved by facts, that dirty or foul water will taint the eggs as quickly as anything and hence, apart from the necessity that pure water is to a fowl's health, it is also a necessity if one would ensure fresh tasting and good quality eggs. Fresh water must be given daily; in winter before the fowls come out in the morning, so that they will not have old or soiled water for their morning drink; and in summer when the birds are up before their human attendants, fresh water should be given the last thing at night. From now till the end of autumn all water vessels should be placed in the shade; sun-warmed water is very injurious to the birds, and anything that affects their health affects the quality, if not the quantity of their eggs. One of the greatest aids to the desirable richness of egg and yolk is to feed the laying hen on an abundance of fresh green grass, clover, or lucerne, chopped and given to the fowls in their soft food. Plenty of green food is essential to the production of rich eggs, and though fowls on a farm may have no difficulty in getting this, as they usually have the run of some field or other, chopped clover should be given them several times a week in their meal food, as there is no feeding more abundant in rich egg formation, and it also contains a large supply of highly nourishing properties.

As necessary as pure water and proper food is an abundant supply of grit and shell-making material. Fowls having no teeth, the food passes at once to the crop, or first stomach, without undergoing any change. From the crop it passes to the gizzard, where digestion proper begins. The gizzard is lined with strong membranes, by which, with the aid of grit, the food is masticated. The gizzard also secretes a powerful liquid that is capable of dissolving stones and other hard substances. Without grit in the gizzard the work of digestion is thrown on the liver and stomach, thus resulting in indigestion and liver disease. As a tonic I recommend charcoal, in the shape of burnt wood cinders. The dealer and consumer have great antipathy to thin-shelled eggs, and the egg of quality has not this fault. To avoid it the hens must be supplied with oyster shell or lime. Old mortor or plaster can always be obtained, and should be placed where the birds can pick it when they please. Under proper feeding conditions, a hen's system usually contains enough lime for the shells of five or six eggs. If lime is witheld, the hen will cease laying, or if lime in limited amounts is given, the shells will be thin in proportion. Old crockery broken up into small pieces, say the size of a grain, is the best grit that one can give one's fowls and it has the added virtue of being cheap and easily procurable.

The Object of Feeding a Balanced Ration.

Poultry and what it produces is only a product of what it eats; the nearer the food is balanced up to the requirements of the poultry needs the more they will be able to produce.

Food stuffs are divided into two main groups—proteids and carbohydrates. Nitrogens or proteids are the albuminous muscle and nerve builders, the carbohydrates the heat and fat; both contain ash in the way of phosphate, lime and salts, which are necessary to animal life. All vegetables and grain contain both protein and carbohydrates, but none in the right proportion when fed alone. The weight of the muscles and nerves of the average farm animal is greater than that of the fat. The animals are not capable of converting fat forming food into muscle and nerves, but all the food they eat must be digested before any of it is available as nutriment, and if they have to digest a lot of feed they have no use for, it is not only a waste in animal energy, but a waste in food also.

Corn, cracked and corn meal is the most relishable food of all grains fed to farm animals and no doubt is more largely fed than any other grain owing particularly perhaps to the low cost, and the advantages in raising it, but when fed alone it is too fattening as a poultry or dairy food.

Oats as a complete ration comes the nearest of any grain grown, but is too expensive when fed alone, but should always be a part of the ration; barley is a good substitute for oats when ground, whole wheat is fattening, but wheat bran and middlings are rich in protein and ash, gluten; cotton and linseed meal are rich in protein, but are hard to digest and should be fed sparingly. Alfalfa and clover meal are rich in protein and contain more lime than any of the grains. High grade ground beef scraps are richest in protein of all feeds. Bone meal is rich in phosphate of lime; oyster shells carbonate of lime.

Poultry when given their freedom to roam the fields in the warm season, will balance their own rations and will be healthy, plump and productive; but when confined to small yards their health and productiveness depend entirely upon the care and feed given them. If given the proper care and a good balanced ration, they will pay you well for your labor. A dry mash feed as a part ration has many advantages over a wet mash or a whole grain feeding. They can not eat dry mash so rapidly, it develops a greater power of digestion and is more easily digested than wet mash or whole grains.

A good ration can be made of the following grains: Wheat bran 25 lbs., wheat or buckwheat middlings 25 lbs., corn meal 10 lbs., clover or alfalfa meal 15 lbs., gluten or linseed meal 10 lbs., ground beef scraps in 10 lbs., bone meal 3 lbs., fine charcoal, 2 lbs.

Scratch food: Cracked corn 50 lbs. wheat 10 lbs., buckwheat 10 lbs., oats 10 lbs., barley 10 lbs., kaffir corn 5 lbs., grit and oyster shells equal parts 5 lbs.—J. A. Jocoy.

Feeding Clover.

If you have a second crop of clover cut it while green and tender, dry it carefully, preserving all the leaves and blossoms possible, and store it up for poultry food in winter. To feed it properly, it should be cut fine and fed dry, but the best way of preparing it is to cut it in the afternoon. At night scald it in a tub or bucket by pouring boiling water over it; throw a cover, old carpet or anything, over the tub, allow it to stand all night, and in the morning it will be still warm and possess a savory odor that will almost tempt you to eat it yourself. To every bucketful of cut hay add one quarter of the following mixture: Ground corn, ground oats and bran, ten pounds; linseed meal, one pound; salt, one ounce; mix well. Feed in a trough, and give the hens all they will eat twice a day. Each hen will walk away when she has eaten all she wishes. The buckets of dry food, scalded at night, as mentioned) will fed about thirty hens, and, perhaps, more, and they will relish it highly. No other green food will be necessary. A gill of wheat may be scattered in the litter, so as to induce the hens to hunt and search.

Feeding Ground Meat.

The usual way of feeding ground meat is to mix it with ground grain of some kind. This is unnecessary. It should be fed as a variety, and in a way to afford a change. There should be certain meals, on special days, for giving it to the hens. For instance, give it at night on every other day in a trough unmixed with other food, so that the hens will have nothing but the ground meat for that meal. The next morning give some other food, as corn, and the following meal may be of wheat or cut clover. The ground wheat may be given plentifully if fed in this manner. Simply allow the hens to have all of it that they will eat, and they will relish it and find it beneficial. If fed on meat every meal it may cause bowel difficulty; but given once every two days it will not be in any manner injurious, and will prove of great assistance in inducing the hens to lay during cold weather.

Water for Fowl.

One of the most imperative needs of young chicks is an abundant supply of fresh clean water. The supply should be so arranged that the birds cannot contaminate it with their feet. Many diseases may be contracted from infected feet. Of almost equal importance to the water supply is provision for a green run for the young chicks.

The world's most successful medicine for bowel complaints is Chamberlain's Colic, Cholera and Diarrhoea Remedy. It has relieved more pain and suffering, and saved more lives than any other medicine in use. Invaluable for children and adults. Sold by all dealers.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Out in the Fields.

The little cares that fretted me,
I lost them yesterday.
Among the fields above the sea,
Among the winds at play,
Among the lowing of the herds,
The rustling of the trees,
Among the singing of the birds,
The humming of the bees.

The foolish fears of what may happen
I cast them all away
Among the clover scented grass,
Among the new mown hay,
Among the husking of the corn
Where drowsy poppies nod,
Where ill thoughts die and good are born,
Out in the fields with God.

Elizabeth Barrett Browning.

Love's Barrier

(Continued from last issue.)

CHAPTER VI.

"BE HE COURTIN'?

Ann Coyne looked out from the door of the shop, up the street and down the street, and saw nothing but the pelt of the rain.

"Eh, them blashes, Aaron, they get on a body's nerves! A'al to Lyddy Rash, a'am thinkin', an' get my body tried on. Shoo woant be busy though theer woant be th' price ov thet body made in th' shoap atween this an' tea-time."

"Nah, that theer winna, lass," replied Aaron, as he spread his capacious arms across the counter. "But away tha goes! It'a bit o' a gossip that wants wi' Lyddy, for sure."

"Weel, an' if it be, Aaron, wheers th' harm? When a woman is soa full up shoo cannot take interest in th' dooins ov her naybors, shee's gettin' ready for Kingdom come. A'am not near ready yet, Aaron. Step back an' git me me owd cloak."

Aaron, whose weight of flesh oppressed him and inclined him to a lazy habit of body, sometimes sore upon his active-brained and active-bodied wife, slowly hobbled round the end of the counter, and took the old water-proof from behind the door at the far end of the shop.

"Seems loike as if the A'mighty had his knife in Midcar, Ann. Nobbut's seen th' sun sin th' Rector came whoam. David Lovejoy se's th' Rector 'as pooiled a mighty long face sin ivver e's bin whoam. Hast tha noticed it, Ann?

Ann nodded solemnly as she folded the cloak about her ample figure. Her comely face, tinted red and brown like a winter apple, lost for a moment its usually bright expression.

"Th' Rector, Aaron, wants takin' in hand like the res' of your sect, bi a good woman what knows her place and his. It's bad for 'im not to be marriet. A'am aye sayin' to Lyddy Rash an' other lonesome females thet a fair to middlin' husband is better than noan. 'Tis th' same wi' a wife. Even if she doo hev a naggin' tongue, shoo be better than nobut; wives be like corny toes, they mekks a body mind theer steps."

With which bit of homely philosophy Ann stepped out into the rain, and turned her face up the steep slope of the street.

Midcar looked as if it had been flung together in a hurry, a handful of dwellings on the windward side of the hill and strangers driving through or seeing it for the first time, never failed to ask who had been responsible. The moor was at the back, miles and miles of open country melting into illimitable space. From the summit of the ridge the land dipped sheerly to one of the more fertile valleys of the West Riding, the beauty of the outlook only marred by the chimneys and the smoke of many factories. Yet not altogether marred for wherever there are signs of life and organized industry, there must be the cheerful bustle of communal life, where the solitary are set in families, and where kindly human interests flourish in congenial soil. Places like Midcar are individual and apart, serving their purpose in preserving intact some of the more rugged types of character akin in some of their elements to the keener atmosphere in which they are cradled.

Ann Coyle knew nothing of types, but was herself one of them.

She was known far and wide beyonds the limits of the little shop in Midcar Street, where it was possible to obtain almost everything that a simple taste could want. Coyle's was well known and patronized within a wide radius; Ann herself being an excellent woman of business.

Aaron was lazy; in other words, what was known in the district as a tyke. Ann put up with him, and had long since given over rating him for his lack of perspicacity, having after much cogitation come to the conclusion that the Almighty, for some reason of His own, had built Aaron that way.

Ann herself was the head and front and core of the Coyne's, as the emporium was familiarly designated, and she seldom slackened her energies. They had done well financially, and had a very tidy balance in the bank at Bradfield, but had none of their own to will it to. Ann's one real cross, for she did not take Aaron seriously now, was her childless state. She was a big-bosomed, big-hearted woman, with room for armfuls of little children, and her unsatisfied hunger sometimes gave her face a strangely pathetic look. She made no moan, however, but filled the gap by mothering other people's children. There were not very many in Midcar. It was a place hard on young tender life, and they seemed to die off in infancy.

The bleak moorland air made for the survival of the fittest, indeed, but there were too many little graves on the churchyard slope.

Often Ann was puzzled over the inscrutable ways of Providence, and when she went to lay out some little figure, nipped like a bud on the stalk, she would make her secret protest against His decree. But she never openly murmured, but preached resignation and hope. Her religion was her life, and she realized, as most women do, that to permit or encourage any assault upon it would recoil upon herself. It was one of the things that had to be left like her own childlessness and Aaron's lazy bones, and Betty Kenward's love for the glass, and Lydia Rash's knotless way of doing, to some far-off but sure day of reckoning, when all things would be made clear.

It had been such a rainy autumn that most of the visitors at the big houses had fled disgustedly back to town, and there had been fewer big orders at Coyne's than Ann remembered for many a year. She felt a little depressed as she set out manfully for Lydia's cottage, which stood hard by the Rectory gate, and was the last house in the village.

Lydia was a dressmaker, a large angular female, with a strident voice, a quick eye and a mouthful of pins. The skill with which Lydia managed to hold so many pins without swallowing one was a subject of frequent discussion and speculation among the children, and Ann sometimes remonstrated with her.

"Ef th' Almighty 'ad meannt us-

WOMEN MAY AVOID OPERATIONS

By taking Lydia E. Pinkham's Vegetable Compound

The following letter from Mrs. Orville Rock will prove how unwise it is for women to submit to the dangers of a surgical operation when it may be avoided by taking Lydia E. Pinkham's Vegetable Compound. **She was four weeks in the hospital and came home suffering worse than before.**

Here is her own statement.

Paw Paw, Mich.—"Two years ago I suffered very severely with a displacement. I could not be on my feet for a long time. My physician treated me for seven months without much relief and at last sent me to Ann Arbor for an operation. I was there four weeks and came home suffering worse than before. My mother advised me to try Lydia E. Pinkham's Vegetable Compound, and I did. Today I am well and strong and do all my own housework. I owe my health to Lydia E. Pinkham's Vegetable Compound and advise my friends who are afflicted with any female complaint to try it."—Mrs. ORVILLE ROCK, R. R. No. 5, Paw Paw, Michigan.

If you are ill do not drag along until an operation is necessary, but at once take Lydia E. Pinkham's Vegetable Compound.

For thirty years it has been the standard remedy for women's ills, and has positively restored the health of thousands of women. Why don't you try it?

Impurities of the Blood

Anyone whose Blood is impure should read this Testimonial

Mr. Chas. Martin, Box No. 367, Kenora, Ont., writes:—"Three years ago, while working in Hamilton, Ont., I was taken sick, and no one knew what ailed me. Every bit of food I ate I vomited up and consequently I became very weak. My landlord told me that after that he thought at one time I was booked for the cemetery. Walking down street one day I happened to see Burdock Blood Bitters in a druggist's window so went in and got a bottle. Before I had taken half of it I broke out, all round my loins in sores. I showed it to my landlord and asked him what he thought of it. He told me it looked as if I had a heavy attack of chicken pox. Both he and his wife tried all they knew how to persuade me to stop taking the B.B.B., but it was no use. I had gotten so bad I thought it did not matter much whether I went under or not, so I got a second bottle and judge to my surprise to see the sores begin to disappear, and by the time I had taken three bottles I did not care for the best man in Hamilton. I am 61 years of age and am able to do a day's work with the next man, thanks to B.B.B.

Burdock Blood Bitters is manufactured only by the T. Milburn Co., Limited, Toronto, Ont.

HOMESEEKERS' EXCURSIONS

The Grand Trunk Railway has issued a circular authorizing all Agents in Canada to sell Homeseekers' Excursion tickets to points in Western Canada. This is interesting information for those desiring to take advantage of these excursions on certain dates from April to September 1911. The Grand Trunk Route is the most interesting, taking a passenger through the populated centres of Canada, through Chicago, and thence via Duluth, or through Chicago and the twin cities of Minneapolis and St. Paul. Ask Grand Trunk Agents for further particulars.

Spring Cleaning

is considered a necessity by everyone and ye they fail to eradicate from their blood the accumulated impurities, whose presence is indicated by listlessness and loss of energy and by the occurrence of canker and pimples. If these impurities are left in the body it is in a suitable condition to fall a prey to tuberculosis and other diseases

For this purpose thousands of people take 2 bottles of

GATES' LIFE OF MAN BITTERS

And 1 of Gates' Invigorating Syrup every Spring

These increase the activities of the organs which remove wastes from the blood, and thus the system is fortified to withstand the summer exertions.

Sold everywhere at 50c per bottle

AND BY **C. GATES & SON, MIDDLETON, NOVA SCOTIA.**

The Maritime Farmer the best medium for advertising.

sen to mekk pin-cushions out of oor mouths, Lyddy, E'd ave provided fer it. Take 'em oot, lass, or yo'll be getten some reet into yor inside, where it'll tekk some cuttin' to get 'em oot. A'am noan keen on the doctors cuttin' intil me, an' that's what'll 'appen to you, Lyddy, if saa be yo bain't more keerful."

But Lydia pursued her even way, and continued to convert her mouth into a pincushion. She took half-a-dozen from it now, in order to give Ann good-day when in her usual familiar way she stalked in at the front door without knocking.

"A'a niver saa such a year fer wet. A'a didn't Lyddy," quoth Ann with a sigh, as she paused to take off the old cloak and shake off the drops from it at the doorstep before she hung it up. "Well, it keeps the dust doon and lets th' weeds oop. It's a puir 'eart that niver rejoices."

Her cheerful tone failed to chase the gloom from Lydia Rash's face.

"Come in, Ann, a'am glad to see that a'am jist aboot fed up wi' they lasses. Thet Kitty Speight is a perfeck little fule, sho'll nivver be towt th' dress-makin', nivver in this world. An thet Megsie, shoo as jes put a gore in Miss Jane's skirt upside down, an' marked it aa, wi' th' needle. A'a was thet ashamed when Miss Jane coom fur fittin' this arternune, a'a didn't kna wheer to luk. Yes, a'am ready fur tha, Ann, coom in, and set doon."

The little cottage, consisting of three apartments, was wholly given up to the business of dressmaking, and, to Mrs. Coyne's orderly eye, it presented an appalling litter of untidiness.

"If they mekks sic a mess ov a simple thing, Lyddy, why doan't tha set them on the to clean the place a bit? Who's body a'am I settin' on now?"

"Nobbut's body, Ann, it's only a piece ov spare linin'. Set doon, an' doan't worrit. Thet bombazine of yours is going to luk real smart, though it do be twenty year ooten th' fashion. Miss Jane, shoo admired it somethin' great. Shoo ses they doan't mek anny stuff to match it fur wear noo-a-days."

"Faith, and ther's wheer shoo's neet, Lyddy," replied Mrs. Coyne, much gratified by this tribute to the wear-resisting fabric to be obtained at her own emporium. "Yo tell Miss Jane neist toime shoo drops in, thet a'a can let her hev a bit cheap. Has Miss Jane been in this haas terday then?"

"Naht moren an hour ago, Ann, an' lukkin' very solemn. Shoos gettin' somethink on her mind, I could amost sweer. A'a nivver saa her look so grit."

Ann nodded understandingly.

"Theers somethink goin' to happen, Lyddy. Now what's tuk the Rector gallivantin' awa' again, an' im not thel lang back frae furrin? Tell you what, Lyddy, it's thet Paris thet 'as done it. A'ave heard it's a terrible bad place, wheer the women folk are noan better than they shuld be, even th' best of them. An' th' Rector, forby bein' a gooid preacher, hasna mooch ither sense. It a'a in Miss Jane's body, pootir dear, I understands jist how she feels. A'ave been the same aboot Aaron in th' byegone days, when he used to travel for woollens. A'al tell you what, Lyddy, yo's best off thet has kep clear of them pooir silly creatures, the men folk. Jist babbys they are, an' no mistake, ought nivver to be let oaff th' apron strings. An' what may Miss Jane be gettin' now in th' way o' dress, eh?"

"A black an' white costume of Halifax tweed, Ann, made like that," she said obligingly turning over the page of a fashion journal to ex-

The First Step In Scientific Farming Is An I H C Manure Spreader

YOU will never get the most out of your soil until it is properly fertilized. And it will never be properly fertilized until you use a good manure spreader, because the use of a spreader will enable you to overcome the practice of spreading on one acre what should be used on two. Why delay the profits that are rightfully yours? Why not look into this manure spreader proposition at once? Learn the many reasons why thousands of other progressive farmers are having such great success with I H C Manure Spreaders.

When you examine one of these spreaders, note the extreme simplicity and great strength of the working parts; note that the beater driving gear is held in a single casting, thus there is no binding nor cutting of parts caused by the gearing springing out of alignment. Notice the roller bearing support for the apron which reduces the draft of the machine; operate the convenient levers; notice how quickly and easily the feed changing device can be shifted, and the wide range of adjustment.

Corn King Cloverleaf

Each of these famous I H C Spreaders is simple, strong, and durable in every part. Each is instantly adjustable to spread light or heavy as your judgment tells you is best for the soil. Whether you have a large or small farm, or whether you want a spreader for orchard use—there is an I H C that will suit your requirements.

Why not see the I H C local agent at once? Let him tell you why I H C Spreaders are so remarkably successful. Get catalogues from him, or, if you prefer, write nearest branch house for any information you desire.

hibit the latest style.

"Marcy me, whoivver drawd thet thing nivver saw a woman withoot 'er clothes," Ann remarked scathingly. "It doan't luk much like Miss Jane, do it now? It'll need a lot of alterin'."

"Miss Jane has good lines," remarked Miss Lydia, with an air. "An' if shee didn't want everything so perfectly plain she might luk a lot smarter than shee doo—but theer, shoo doan't think it matters ow shoo lucks, Miss Jane doan't."

"Her mind is occupied wi' something better, Lyddy. A gooid 'eart as th' Rector's sister, aghter be more thankful to 'er than we ware, Lyddy."

"I doan't see thet we're so onthanful," answered Lydia. "A'a think th' Rector doesna know jest th' value o' Miss Jane in th' Parish. It seems to me, Ann, thet though yo an' other women-folks maintin that anny kind o' a man abaat the haase is betterin noan, they need a sight o' toom to theerselves, them same men. Shall a'a tell you what a'a thinks, Ann, concarnin' th' Rector? Well, thet he's coortin' so theer!"

"Stuff an' nonsense, Lyddy Rash; doan't yo go fer to be noan siller than you can help. Mr. Secretan, 'e believes in the celebrity o' the clergy. 'A'ave 'eard 'im an' Coyne at it tooth an' nail ov a Wednesday evenin' behind the shoap."

"Yo wait an' see, Ann! Why there be th' Rector for sure, goin' in be the gate now, iso't it?"

Ann flew to the window and peered over the little curtain, at the same time unconsciously straightening its ragged edge.

"Yes, it be he, an' a fine figger ov a man our Rector be, for sure, Lyddy An' as to wimmin, 'e could choose wheer he likes. Take Miss Audrey, now. Thet would be a match, an' he'd get the brass that would mekk a' the difference to 'im. 'Ow old wooid yo think the Rector to be, no' Lyddy?"

"Nearer forty than thirty. Here's the body ready then, Ann, if so be yo're ready to have it fitted. Will yo fit now?"

"A'a doan't mind if a'a do," and while Lydia, with her mouth once more joyfully fu'l of pins, bent to her difficult task, Mrs. Coyne kept up a running commentary an the fitting, and on the Rector's matrimonial prospects.

All unconscious how near their homely gossip had hit the mark, Secretan strode on, and Jane, while sitting down to her solitary tea, saw him pass by the window. She ran out, conscious of relief so sudden as to be almost overwhelming. Since the moment when he had confided his impending journey to her, she had somehow felt as if she had lost him. To see him in the flesh, smiling the familiar smile upon her, was almost too great a relief.

"Oh, I am so glad to see you back, Claude!" she cried a little breathlessly. "You can't think how long the time has seemed; much worse than while you were in Paris."

She took his dripping umbrella, ran with it to the kitchen, gave Hannah hurried instructions to get something more substantial for tea, and was back to help him off with his coat.

"I just managed to catch the one ten from Euston. It was a bit of a rush. Liverpool Street and Euston are so far apart. I had an uncommonly good little cob in the hansom, or I couldn't have done it."

"You did not sleep in London last night, then?"

"No, at Colchester. How cold it is here, and how dismal. I wonder when this wretched weather is going to mend. I have seldom seen the place look more gastly."

"There is a nice fire in the dining-room and the study shall be lighted at once," said Jane's cheerful voice, which had the quality of dispelling difficulties and making light of troubles. "I have been at the Court Farm most of the afternoon. Did you have dinner before you left London?".

"No, I've just explained what a near shave I had to catch the train. Ah! this is better!"

He strode to the cheerful fire in the dining-room, and stretched out his hands to it. Jane laid on another log.

"I'm always setting out and coming back in what Ann Coyne calls a blash. Most of the fen country is under water. Are you all right, dear?"

He looked at her critically as he asked the guestion. Jane undoubtedly was not looking her best, nay, it may be frankly conceded that she was looking her very worst. She had an old frock on, extremely short in the skirt and skimpy about the bodice, and her straight hair, coming down smoothly on her temples, its grey streaks plainly visible, seemed to throw her features into harsh relief. Jane flushed a little, immediately conscious of an unusual observation.

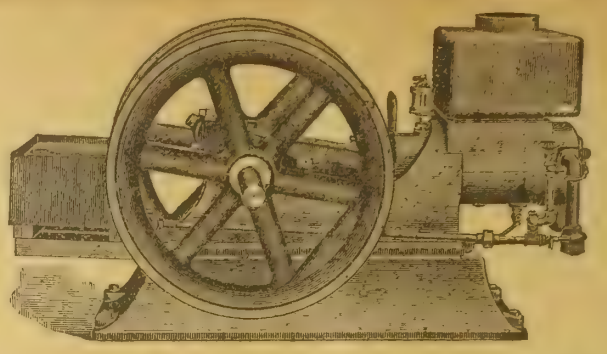
"It is a long, dirty walk to the Court, as you know, Claude, and not expecting you, I did not change my frock for tea. Indeed I was to hungry and tired to wait for it. Poor Tom is in great trouble. That housekeeper he got from Bradfield drinks like a fish, and he turned her out yesterday."

"Drinks, does she? Then there'll be two of them," remarked Secretan

"No, no! Honestly he is trying his best for poor Emmy's sake and the children, to keep straight. I really wish I could find him the right sort of person. The question is where to look. I think I shall go into Bradfield to-morrow or Monday myself, and see what I can do. Come, sit in to the table, dear, and have something to eat. This is one of the Court Farm fowls. I cooked it this morning on the off chance of you getting back to-night."

Secretan drew his arm chair to the bottom of the table and sat down slightly contracting his brows. He was drawing a sharp comparison between his home and the one where he had left the woman he loved. There was a great gulf fixed, and the thought of transplanting Helen, who loved beautiful things, and could create the atmosphere of them where ever she went, to this ugly house, filled him with apprehension. Yes, ugly was the word. Everything in the room had been bought with sacrifice, but it did not contain a really beautiful or ornamental article. Poor Jane had not been taught the grace of home-making, her taste had never been educated, and it remained where it began, hopelessly crude, elementary, middle-class. Spartan-like she had been raised, and Spartan she would remain to the end.

Secretan wondered how it would all strike Helen, and, above all, what would be her attitude towards his sister. Undoubtedly Jane was the lion in the path. He had already proven Helen's caustic tongue. He could imagine the few scathing sentences in which she would dispose of



The Waterloo Boy Gasoline Engine

s like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new postitive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogue is free. Write to-day.

The Waterloo Gasoline Engine Co.

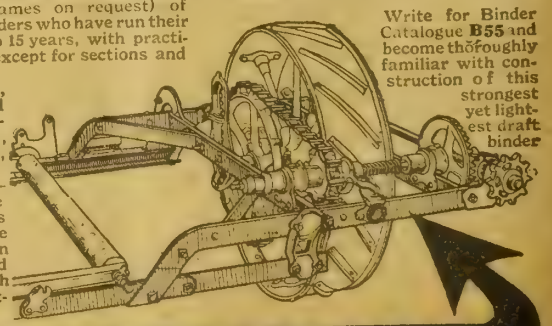
Frost & Wood No. 3 Binder
Has a Strong "Back Bone"

Dropping into a furrow harder than intended, or accidently striking a boulder, does not "wreck" our No. 3—because it is built to stand more "hard knocks" than a binder is commonly supposed to encounter. The No. 3 Main Power Frame—the binder's "back bone" -consists of heavy pieces of steel firmly rivetted together. The Platform is connected to the Main Power Frame by a Double Steel Brace (see illustration). Hard work and rough ground have no effect on this brace. Certainly, no possibility of it sagging. Indeed, every single part of the No. 3 is of the best material, securely bolted, rivetted or welded to some other part. It's the QUALITY, in material and workmanship, that we put into our binders that enables them to beat, by five times over, the two or three seasons' durability-record of other binders. Why, we know owners (names on request) of Frost & Wood binders who have run their machines for 12 to 15 years, with practically no expense except for sections and oil.

The No. 3 cuts, binds and ties all kinds of grain—whether light, heavy, short, long, broken or lodged. It's no "quitter"—never goes to the fence. You always can count upon the No. 3 to do more than its share of the hard work connected with Canadian Harvesting.



Write for Binder Catalogue **B55** and become thoroughly familiar with construction of this strongest yet lightest draft binder

"Canadian" conditions are "different" from those prevalent in other countries. It is well for the "Canadian" farmer to remember this. He will find it will pay him to purchase from a Canadian Company who know the requirements of the different sections and who build their machines accordingly. The Frost & Wood Co. have been manufacturing Farm Implements for the last 70 years and have the very best and most prosperous farmers as customers.

Frost & Wood organization covers Canada from Atlantic to Pacific. Branch Warehouses in New Westminster, Calgary, Edmonton, Regina, Brandon, Winnipeg, Toronto, London, Ottawa, Sherbrooke, Montreal, Quebec, St. John, Truro and Charlottetown. Your "local" agent can thus on shortest notice obtain for you (if he hasn't it on hand himself) any Frost & Wood Machine or part thereof that you may desire.

e limitations of Jane. It did not cur to Secretan that these disloyal oughts proved his own limitations, d that he was wholly unworthy of e loyal devotion of his sister's art, or the surrender of her life.

She, poor soul, not knowing why how she was being appraised, yet t herself weighed in the balance d found wanting. Again the feel- of aloofness, of being on the out- e, which had come so sharply me to her heart on the eve of his urn from Paris, swept over her.

'I-ve had tea, dear, so if you'll ex- e me, I'll leave you to enjoy yours l go and see whether Hannah is ng successful with the study fire." he rose and moved towards the or, but he called her back.

What nonsense! Let Hannah see the fire, and get it right. It's at she's there for. You are far fussy. There isn't a scrap of re- e about you anywhere. I want here."

he turned back rather quickly, nded by his tone.

I am glad to know that you do rt me, Claude," she said a trifle ly. "But you might easily speak ttle more pleasantly without hurt- yourself. I don't care for these ds you bring back with you when go away."

Don't get cross, old girl," said retan, a trifle ruefully. "Come sit down here. Don't you see, can't you see—it's a confession I want to make, and that I don't know where to begin?"

(Continued next issue.)

The Power of Sympathy.

Although conscious of the power of sympathy, many loving but over-tired mothers not only forget to show affection but form a habit of constant reproof. Naturally enough the children, unless exceptionally callous to their surroundings, become sullen and resentful. How can they realize that the nagging is an expression of anxious affection?

When Johnny comes rushing into the house, full of enthusiasm over some new play or new idea, and eager to tell his plans, such a mother exclaims, "How many times have I told you to wipe your feet before you open the door?" The greeting kills his enthusiasm, and hurt and wounded, he draws back into himself, and will not again expose himself to such a snub. He confides in her less and less as he grows older, and she wonders why.

An English instructor in physical training has noted that children who are constantly nagged are hollow-chested and sullen. The fear and resentment of which their hearts are full shows in their physical bearing. The same instructor was asked by a woman to help her improve her carriage. "My sister walks as if she owned the street, and I want to do the same," she said. But it was impossible to make the woman hold up her head and look the world bravely in the face; her spirit had been broken by a brutal and domineering husband. Adults, as well as children, are afflicted by lack of sympathy and approval.

There is sound psychology in the statement that if you believe a man is honest he will be honest; that if you trust a young man he will prove trustworthy; that if you praise a child he will deserve praise. Benjamin West's mother kissed her boy when he showed his drawings to her, and the boy, when grown to manhood, said that her kiss made a painter of him.—Youth's Companion.

THE FREDERICTON EXHIBITION.

The Prize List of the 1911 Fredericton Exhibition has been received and is a very nicely prepared booklet, well printed and attractive in its make up. The Association offer Fifteen Thousand Dollars in Cash Premiums, and several innovations, including a Milking Test, appear for the first time at a Fall Fair. Substantial premiums are offered in Live Stock, Poultry, Dairy, Agricuttural, Horticultural and Florcultural Products The Ladies' Department is enlarged by many additional sections in the Fancy and Domestic Work and over $500 placed in the list for division among the ladies who exhibit specimens of their work. The Prize List will be mailed free to the Secretary, W' S. Hooper, Box 150 Fredericton, N. B.

Fredericton has always been in the front line of Maritime Shows, and the Board of Directors, with few exceptions, the same for the 'ast sixteen years, and many of them, including Secretary Hooper, intend retiring after this year, are endeavoring to make this their final effort, the "Best and Biggest ' of all.

Extensive additions and improvements to both buildings and grounds are being made and a large body of men is now engaged in making ready for the opening, September 16th. The Main Industrial Builuing is having an addition 128x80 feet now being erected, which will make what will be practically one large building about 350 feet in length, undoubtedly the largest Fair building, under one roof, East of Toronto This new addition will provide for an Amusement Hall on the second floor, and will be to every particular an up-to-date Theatre with a seating capacity of about 1200. The ground floor is to be used by the Provincial Governm nt for use of future Farmers and Dairymen's Conventions and Winter Fairs for New Brunswick to be held in Fredericton is not at all improbable this new building being designed, and heated by steam, for such a purpose should the intention be carried out.

The enclosed grounds are being extended back 200 feet, allowing for a new show ring, which will be one-eighth of a mile, and a Transportation Building is being provided for exhibits of carriages, sleigh, automobiles etc,

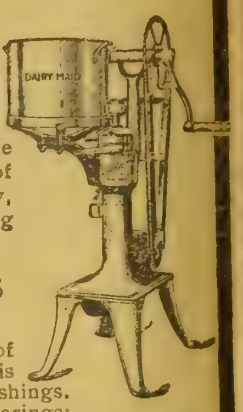
The Amusement Attractions this year will be on a larger scale than ever, several thousand dollars more being provided for this branch than in former years, and in addition to the Amusement Hall programme, two Shows of over half an hour each will be put on free in the enclosed grounds every day of the Exhibition.

Trotting and pacing, under the direction of the Fredericton Trotting Park Association, with large purses, will prove a great attraction to horse lovers, and with competition open to Canada and United States horses, large entries are looked for and record breaking speed expected.

The Fredericton Exhibition advertisements appears in this issue and we ask for it the attention of our readers.

A young fellow from Underwood in town last week, when asked what he thous ht of Reciprocity, replied his mother never used any other than Red Rose —(Port Elgin, Ont. "Times.")

When The Cow Has Done Her Part



OF COURSE it's important that the cow do her part. But after that, it's up to your cream separator. If it doesn't get highest quality cream—if it doesn't skim to a trace—you are robbing yourself of the profit that your cows have produced.

I H C Cream Harvesters get full value out of the milk, not for a few months only, but through years of constant service. They have proved their durability, close skimming, easy cleaning, and easy running advantages.

I H C Cream Harvesters
Dairymaid and Bluebell

are the only separators with dust-proof and milk-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. These separators have large shafts, bushings, and bearings; the flexible top-bearing is the strongest and most effective found in any separator. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated. I H C Cream Harvesters are made in two styles—Dairymaid, chain drive; and Bluebell, gear drive—each in four sizes.

The I H C local agent will be glad to point out the above features and many others, or, write to nearest branch house for catalogues and other information.

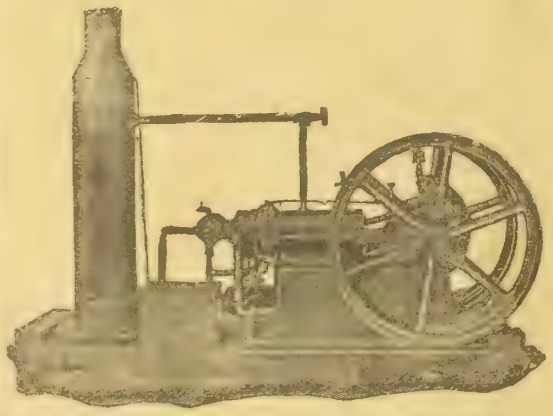
Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power.

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature, is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

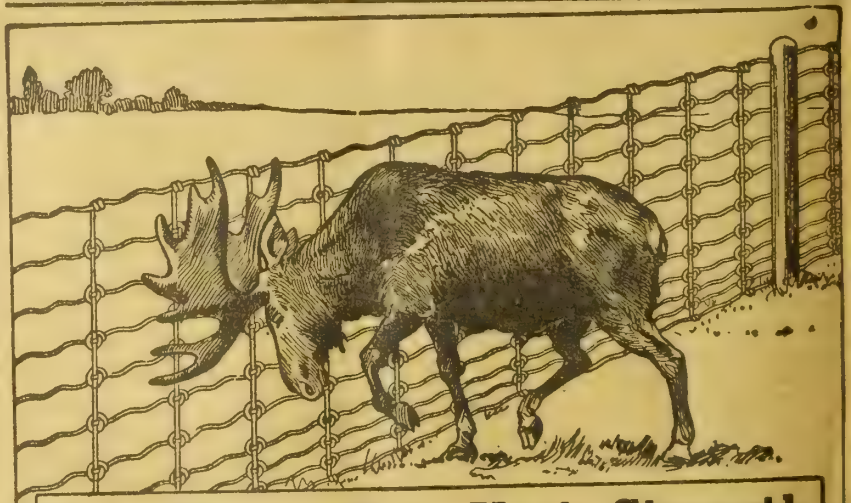
GOOLD, SHAPLEY & MUIR CO., Ltd., - Brantford, Ont

Maritime Address--29 Dock St., ST. JOHN.

J. A. Pugsley & Co., St. John, N. B., Agents.



This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

NEW BRUNSWICK WIRE FENCE CO., Ltd., Moncton, N.B.

MARITIME WIRE FENCE

When Pasture is Poor.

The advantages of a good pasture can be replaced by the regular use of Herbageum. It has been used and tested for about twenty five years without failure with horses, cows, fat cattle, sheep, pigs and poultry. It insures good health and better returns. It keeps sheep free from ticks and the wool clip will be heavier and better. The flavor of milk and butter are improved when it is given regularly. As good calves can be raised with skim or separated milk and Herbageum as with new milk, and when milk is scarce do not kill your calves as you can make a fine calf meal, equal to any on the market at a cost of 1½c. per lb. Try the following 100 lbs. oil cake meal, 300 lbs. shorts, 4 lbs. Herbageum, and about 1 lb. of salt. Mix these thoroughly and stir about two cupfulls in a gallon of scalding water and feed warm. With poultry good health, brilliant plumage and plenty of eggs are sure if you will use Herbageum.

The House Fly.

This fly, called "Typhoid Fly" on account of its being known as a carrier of typhoid germs, is one of the filthiest insects with which we have to contend. It also carries the germs of tuberculosis and other diseases, and is a menace to the health of the family.

It breeds in fresh horse-manure and other filth, hence, when the stable is near the house, flies are apt to be more numerous. Use screens on the windows; resort to the use of sticky fly paper; keep garbage-pails and privy vaults securely closed; if possible, keep stable manure covered.

Some farmer's wives hang sticky fly paper, sticky side out, on the outside of their screen doors, at the top; which, in warm weather, catches flies which gather there.

Flies are attracted, and can be killed by the following solution: Place in a room two teaspoonfuls of formaldehyde (formalin) in a pint of water. Flies drimk this and shortly die. This not only kills the fly, but serves to disinfect the insect after death.

Intestinal discharges from patients suffering from typhoid, or any other fever, should be sterilized before being emptied into sewer or cesspool.

More Advice on Potato Bugs.

Potato bugs are at work. They are an enemy to be poisoned by the potato grower. War must be commenced early and continued with vigilance. Paris green is the most highly recommended. It may be used as a spray, with a sprinkler, mixed with air slaked lime, flour, or fine, dry road dust, sifted over the potato plants when covered with dew or rain In any form of application at least one pound of Paris green should be used per acre, but when the plants are large a greater amount may be required. The Minnesota Experiment Station, prefers to use Paris green mixed into a thin paste with water and then stirred in the large volume of water to be used in a sprayer. Very good results, however, have been obtained by the use of a common sprinkler. Where the crop is large and it is possible to procure one, a power sprayer is advisable and regarded as almost indispensable. Milk of lime, made by slaking two pounds of stone lime in water to each pound of Paris green, should be carefully strained into the poisonous mixture to prevent burning of the plants. Arsenate of lead may be used as a potato bug poison, but it is more expensive than Paris green. Paris green may be mixed with Bordeaux mixture, when the mixture is used as a disease destroyer. In this case no additional lime need be added.

Cut Worms.

Wheat bran and Paris green kill these pests.

There are two things to be remembered in using this compound; it will kill poultry or anything else that eats it, and if applied too heavily on young, succulent vegetation, it will kill that too. Hence, keep poultry away, and apply not on the plant or against them; the worms prefer this mixture to vegetation.

The bran and Paris green remedy is a boon to the vegetable grower; it is easy to obtain, but little trouble to mix and apply; 50 to 100 pounds of the mixture will suffice for an acre according to the closeness of the plants.

Use one pound of Paris green to 50 pounds of wheat bran, mix dry, then wet to make a stiff mash. It will of course kill birds and that is a serious objection.

The most successful way to use the above formula is to apply it ahead of the plants appearing. The worms are very hungry when they first become active. If we will apply this mixture before the crop appears the worms being hungry and fond of the bait, they eat and are finished.

For tomatoes and other transplanted things the wrapping of one or two thicknesses of paper about the stem, so that it reaches a little above the surface at the time of setting, will save every plant. In a field or large truck patch this might take too long, but in the home garden it will save the tomatoes, peppers, pansies, asters, etc., without fail and is not much trouble. Have a bunch of papers cut into strips say an inch wide and a couple of inches long and the trick is easily done.

FLORICULTURE

St. John correspondent writes: I have a Rex Begonia, a beautiful, large plant, and looks healthy but apparently will not stand the light. If kept in the window when the light is strong, even on a cloudy day, it will droop so that the leaves actually hang over the edge of the pot. Then during the night it will straighten up as fresh as ever until it has been in the light again for a few hours. It is in a warm room and window, it being an east window. What should I do to prevent this trouble?

I am afraid that without further particulars as to size of pot, time of repotting, watering, etc., I could only suggest giving it partial shade. Some varieties of Rex Begonias are very impatient of light, especially sunlight and have to be removed in that respect.

Shediac, N. B., writes:—Last year I cut my Rubber Plant down. It had grown as high as the ceiling of the room. I made cutting and tried to make them grow but they both died. Now on the old there are but few shoots. What I want to know is if I can take these shoots of the old stalk and make them grow? If so, how will I treat them? Shall I take them off this month or later?

We usually root cuttings of this plant by taking the tips and placing in sand in a box on the heating pipes thus giving them bottom heat. They might possibly be rooted in a box or pot of clean sand if kept constantly moist in an even temperature of 60 degrees. To do this requires some care. Another way if old fashioned, might suit you better. Get some coarse wood moss, or better, the long Spagnum or Swamp Moss, make an incision in the branch you wish to root, a small cut will do, about this tie a large handful of this moss quite tightly, saturate thoroughly with water and keep constantly moist. of blossoms as large as a water pail. Once dry would be fatal to your hopes. This will ordinarily cause the roots to form at the incision and when they become quite distinct you can cut off the stem below them and put in soil, keeping moist and in the shade for a few weeks.

A. S. St. John, writes: What do you think of Begonia Gloria de Sorraine?

It is truly a beautiful plant. It is a mass of vivid pink flowers, the season through. Unfortunately it requires considerable heat and moisture and does not stand the dry air of a house during the winter very well, but during the summer months it should be a splendid plant for the window. It wants plenty of sun and water, does well right up in a sunny window. This plant when well grown will bloom so profusely that the foliage is almost entirely covered. They require very little root room. A plant in a six-inch pot having a mass

INTERNATIONAL STOCK FOOD CO., Limited
TORONTO, ONT.

EXCURSIONS TO WESTERN CANADA.

The Grand Trunk Railway System announce that on Tuesday; June 13th and 27th, July 11th and 25th, August 8th and 22nd, September 5th and 19th, 1911, Homeseekers' Excursions will be run from all Stations in Ontario and Quebec to Western Canada, via Chicago and Duluth or via Chicago, St. Paul and Minneapolis, at reduced rouud trip fares.

The well-known double track line of the Grand Trunk from the East of Chicago appeals to the traveller, and with the superior train service that is offered by this line, including the famous "Internationsl Limited" from Montreal daily at 9.00 a. m., and which is the finest and fastest train in Canada, many passengers will be attracted this way. The route via Chicago is a most interesting one, taking passengers through the principal cities and towns in Canada and in the States of Michigan and Indiana. In addition to this a choice of seven lines between Chicago and St. Paul and Minneapolis is offered.

Owing to the great number of Canadians who reside in Chicago, St. Paul, Minneapolis, Duluth and other cities en route, there is no doubt that the Grand Trunk will find many patrons who will take advantage of the opportunity thus afforded them for a brief visit at the stations with their friends.

Canadian citizens are exempt from so-called Immigration Examination, and there is no detention at any point.

Baggage is carried through the United States in bond without requiring any special attention on the part of the passenger. Inspection is not necessary at any of the points at the Border.

Another feature that will appeal to the homeseeker is the comfortable transfer at points like Chicago, St. Paul and Duluth into freshly ventilated clean cars, avoiding the necessity of travelling a long distance in the same car.

In addition to the above routes, the sale of tickets is also authorized via Sarnia, and the Northern Navigation Company's magnificent Steamers across Lake Huron and Lake Superior.

For further particulars apply to any Agent of the Grand Trunk Railway System, or write to Mr. J. Quinlan, District Passenger Agent, Bonaventure Station, Montreal, or Mr. A. E Duff, District Passenger Agent, Union Station, Toronto.

The Lightning Rod.

Last month there occurred a disastrous fire which completely destroyed the capitol building of Missouri causing a loss of from one to two million dollars. The building was struck by lightning. While two million dollars many not mean a very heavy draft on any one of the prosperous farmers and citizens of Missouri, the loss to the state is nevertheless great When one realizes that comparatively few dollars would have secured protection from a disaster of this kind, he cannot fail to appreciate the shortsightedness in ignoring the necessity of taking preguard against similar losses. All significant that the building at the national capital, such as the white house and navy buildings are equipped with lightning rods so as to guard against similae losses. All these things are more or less impersonal because they refer to the state or the nation rather than to the individual. We were shocked when we heard about the fire at the Missouri capital but we would have been more concerned if it had been our dairy barn filled with good cows and an abundance of high-priced feed. The loss would not have been so great, yet it would have been extremely personal and we would have felt it keenly. The only way to guard against such losses is to provide protection before the loss occurs. Itis poor policy to lock the stable door after the colt is stolen. It is equally poor policy to buy lightning rods after one of the buildings has been burned.

During the summer it is no uncommon sight to find the horizon lighted up by burning buildings every time there is a severe thunder storm. Frequently four or five of these will be blazing at once. Every fire means a serious loss, not only because of what goes up in smoke, but because of the delay that is sure to follow in handling the farm work. Too frequently there is no insurance to fall back on. This is another extremely short-sighted policy. There are two things that every farmer ought to have on every building on his farm. One is a good insurance policy and the other is a good equipment of lightning rods.

It has only been a comparatively few years since the lightning rod business has been considered legitimate and dignified. When the editor was a boy, the lightning rod agent was put in the same class with the dealer in gold bricks or the confidence man. This was due to some disreputable deals that were made in every community, not because any discredit could be attached to the lightning rod itself as a means of protecting the buildings, but because of the business contracts too frequently entered into by the unscrupulous man who posed as an agent for some fictitious company. All these things have been cleaned up and today the lightning rod business thanks to the energy of a few progressive firms, is as clean, honest and secure as any other line of commercial activity.

Lightning is a very fickle and uncertain natural force at best. It is something that you can never foretell and every possible precaution against losses which it may cause should be taken. The lightning rod is the surest, safest and most feasible of these precautions. It stands to reason then that the lightning rod is a necessary adjunct to farm equipment. Once installed it is always on the job. There are no expenses of upkeep, there are no annual premiums to pay, in fact no further demands of any kind can be made upon the farmer's pocketbook. Furthermore the lightning rod is a great blessing because it saves worry and anxiety on the part of the farmer every time there is a severe storm; it matters not whether he is at home or in town, he cannot fail to wonder, at least, if he is going to find his buildings intact or a heap of ashes when the storm is over. If his barn is equipped with protection of this kind he can feel safe. The lightning rods should be installed because they provide safety for human life, safety for the farm stock, because they are the greatest economy in protecting the buildings against loss and finally they give one a feeling of security and safety at all times.

I H C OWNERS ARE PROUD OF I H C WAGONS

There is a certain pride in owning a wagon that you know is built of the highest quality materials obtainable—a wagon that is not only attractively finished with the best paint and varnish, but which also gives perfect service, day after day, and year after year. That's why I H C owners are so proud of their wagons.

If you want to be proud of your next wagon—choose one of these two in the I H C line—

Chatham or Petrolia

The loads they carry, the roads they traverse, and their wonderful durability make others wish they had bought a Chatham or Petrolia.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Petrolia Wagons are constructed of first quality woodstock which is thoroughly seasoned by being air-dried. The ironing is of the very best. The inspection of each part is most rigid.

Be sure to call on the I H C local agent, get a pamphlet, and let him show you one of these wagons. If you prefer, write the International Harvester Company of America at nearest branch house for any information you want.

IHC Service Bureau

This Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

Why Every Breeder should Have a Typewriter.

After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

United Typewriter Co., Ltd..
Prince William St., - St. John, N. B.

Potato Beetle Destruction.

During the past few years the potato beetle has been spreading very rapidly in Western Canada. For several years a few of these insects used to be seen season after season in the eastern parts of Manitoba, but, like many other dangerous things, they were never regarded seriously, and we were told that they were not spreading. But now potato beetles are to be found almost all over Manitoba and away westward into Saskatchewan.

As a result of this increase in numbers, there was last year—and there again will be this year—a very general enquiry as to the best method of destruction. In view of this fact, we offer the following advice: The potato beetle (or potato bug, as many call it) is a biting insect, and so must be attacked by something that poisons its food. Generally, in the past, the poison used has been Paris green, and this has given very fair satisfaction, although if put on too heavily it is liable to burn the foliage and if used too sparingly, or wrongly, the poisoning is not always satisfactory. However, it is very much better to use than hellebore, which some farmers used last season, but which is of very little, if any, benefit for poisoning this insect.

Some time ago we had the opportunity of interviewing W. T. Macoun, Horticulturist, at the Central Experiment Farm, Ottawa, on this matter of potato beetle poisoning. Mr. Macoun has for years given special attention to potatoes and is probably the best informed man in Canada regarding this most useful tuber crop. As the result of his 25 years' experience, he says that he has had better results in killing potato beetle with a mixture of Paris green and arsenate of lead than by Paris green alone. He also uses a stronger mixture than is generally recommended. His formula is: 8 ounces Paris green and 1½ pounds arsenate of lead to 40 gallons of water. This is more Paris green than is generally advised with the arsenate of lead thrown in extra. If the lead arsenate is used alone, he recommends 3 pounds in a 40 gallon mixture.

One reason for general disappointment is that many persons throw Paris green on the top of a big body of water and try to stir it in. The poison, which does not mix readily with water, clings to the vessel and gathers into lumps, and is never evenly distributed in the water, and so never properly conveyed to the plants. The correct method is to make a paste of the poison with a small amount of water, then thinning this paste down into a strong liquid solution, and adding this to the big bulk of water. By doing this the poison can be we,, distributed in the water. Then stir the contents of barrel before each fresh lot is dipped out.

Another point is that the water should be put onto the plants in as fine a spray as possible, so that it may remain on the leaves. If the spray is fine enough and not too abundant, it will be retained by the foliage until the water has evaporated and the poison been left to dry on. But if a heavy coarse spray floods the plants, the water runs readily off carrying away most of the poison, and the only place where there is an abundance is at the leaf tips, where the last drops have hung and evaporated. Mr. Macoun does not recommend dustingwith dry powder, practised by some, as being as satisfactory as spraying.

The first potato beetles generally appear each season about June 15, and they can be found from that time until the potatoes are dug in the fall. We would advise all our readers who have been troubled with them to try the poisoning, as it is a very easy matter for the beetle to lessen a crop of potatoes by fifty bushels to the acre.—N. W. Farmer.

$3,600

in Cash Prizes for Farmers

Your Photograph May Win a Prize

AMONG the prizes we are offering in our big Prize Contest is one of $100.00 (Prize "C") for the farmer in each Province who furnishes us with a photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. For this prize, work of every description is included.

Now just as soon as you finish that new silo, barn, feeding floor or dairy, that you've been thinking of building, why not photograph it and send the picture to us? The photograph doesn't necessarily have to be taken by a professional or an expert. In fact, your son's or your daughter's camera will do nicely. Or, failing this, you might use the kodak of your neighbor's son nearby. In any event, don't let the idea of having a photograph made deter you from entering the competition. Particularly as we have requested your local dealer to help in cases where it is not convenient for the farmer to procure a camera in the neighborhood. By this means you are placed on an equal footing with every other contestant. Get the circular, which gives you full particulars of the conditions and of the other three prizes. Every dealer who sells "CANADA" Cement will have on hand a supply of these circulars—and he'll give you one if you just ask for it. Or if you prefer, you can use the attached coupon—or a postcard will do—send it to us and you'll receive the complete details of the contest by return mail.

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

If you haven't received your copy of "What the Farmer Can Do With Concrete," write for that, too. It's a finely illustrated book of 160 pages full of useful and practical information of the uses of concrete.

Write us to-night, and you'll receive the book and the circular promptly.

Do not delay—sit right down—take your pen or pencil, and fill out the coupon NOW.

THE MASSEY-HARRIS CO., Limited, Moncton, N. B.

Cultivattion of the Alfalfa Crop.

(Continued from page 727.)

not make much growth alone. It in turn furnishes the germs with food of a different kind so, it is a co-operative affair, each furnishing that which it can secure easiest. When the alfalfa is starting it does not have the germs on its roots and so is very delicate and must be given good care. The germs will multiply faster in the soil if it contains manure, and if the germs are not in the soil it may be necessary to introduce them. The best way to do that is to get some soil from a field that has been growing the alfalfa successfully for a few years and sow it on the new field at the rate of 200 pounds per acre. —N. D. Extension Bulletin.

STOCK NOTES.

Your attention is directed to the Advetisement in this issue of the Pure Bred Ayrshire Bull owned by E A Schofield at Hampton. This is a particularly well bred fellow, his dam having qualified for the record performance, and his grandsire was a champion at the St. Louis World's Fair.

Mr. Schofield has been using this bull for the past two years, and is only selling him to avoid in-breeding.

Anyone wishing to purchase an Ayrshire to head his herd could not do better than have a look at this fellow.

The Farm is near the Station at Hampton, N. B.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

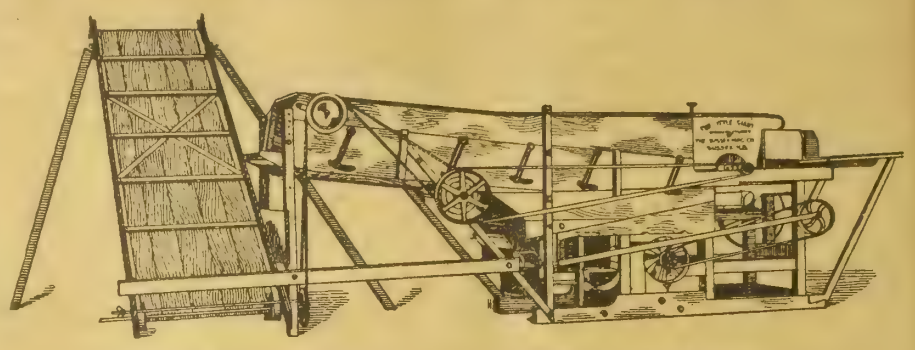
MacKay Station, Col. Co., N.S.

The Best Judge of a Thresher

Is the Man Who Has Used it.

It's not the purpose of this advertisement to tell in detail the merits of the Sussex Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Should any reader wish a detailed description we will mail descriptive catalogue on application.



Four Horse Thresher may be operated with 5 to 7 H. P. Gasoline Engine.

THE SUSSEX MANUFACTURING CO., Sussex, N. B.

DEAR SIRS:—It affords me much pleasure to write that the Threshing Outfit purchased from you has given entire satisfaction. The nearest estimate I can give as to the number of busnels threshed is 60 bush. of oats in one hour.

I find, that the Sussex Little Giant Threshing Machine is far ahead ofany other threshing machine I have ever used. I remain, Respectfully yours, E. F. CRABB, Greenwich Hill.

We manufacture the celebrated Little Giant Threshing Machines—the best on the market—in one, two and four horse sizes. Centrally located, as we are in Sussex, we are wthin easy reach of all parts of the Maritime Provinces and can cater to your wants better than any other Canadian or American firm. Send for cuts, descriptions, prices and full particulars to-day. All inquiries receive our careful and prompt attention.

THE SUSSEX MANUFACTURING CO., Ltd., Sussex, N. B.

MARKETS.

MISCELLANEOUS.—Straw, $7 to $8 ton; Wool, 14c to 21c; Calf Skins. 16c. per lb, Sheep Skins, 18c to 25c.; Lamb Skins, 18c to 25c.

The Market was poorly supplied this week. It bids fair for the next week. Lamb is coming quite plenty; Strawberries are about done; New Potatoes selling high, $1.50 per bushel; Blueberries bring 10c to 12c. per box.

The Beef Market is in the hands of Gunn Co. and D B. Martin of Ontario. They are doing a thriving trade, and it looks as if they will drive our butchers out of business,—

First Class School for Girls and Young Women

The Catalogue of Acadia Seminary, whose advertisement appears elsewhere in our columns, has come to our table. An examination of the booklet, which is well printed and illustrated, shows that the work of this well known school is organized in **three departments.** The **Academic Department** includes the Collegiate Course, the Sopomore and Freshmen Matriculation courses. The **Fine Art Department** included courses in Music—Pianoforte, Voice, Violin, and the usual theoretical branches—Art, in Oils, Water Color and China Painting, and the new work in Arts and Crafts, and Oratory. The **Department of Practical Arts** provides courses in Household Science, Business, Stenography and Typewriting. All of these courses are characterized by modernness, breadth and thoroughness, and aim not merely to prepare the pupil for the professions open to women but for COMPLETE LIVING.

To do this Work a staff of **twenty teachers** of fine personality, qualified by training, temperament and experience, is employed. Admirable provision is made for the development of the physical life of the girls by the presence on the staff of a resident Trained Nurse and a competent Physical Director. Simplicity in living and dress, high ideals in conduct and thoroughness of work are insisted upon. That the school is a popular one is evidenced by the fact that duriug the last seven years the registered attendance has been doubled.

Full particulars concerning the work of Acadia Seminary may be had by writing PRINCIPAL H. T DeWOLFE, Wolfville, Nova Scotia.

Dates to Remember.

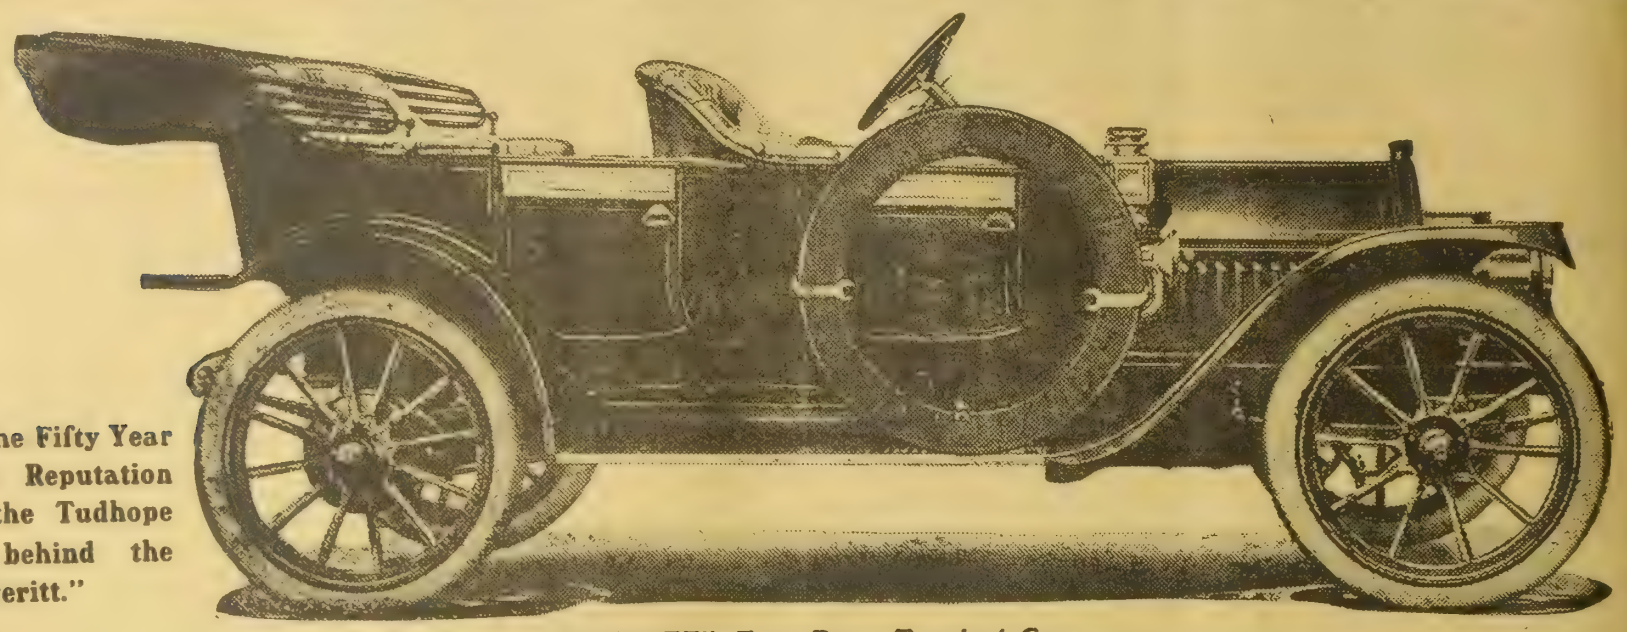
Why You Should Get an Automobile.

Why the Car Should be an

"EVERITT"

Low Gasoline Consumption--Easy Adjustments--Large Capacity--Wear Resisting Parts--Accurate Machining--Great Strength--Tudhope Two Year Guarantee.

The "Everitt" Gives More Value for Your Money than Any Other Car



The Fifty Year Old Reputation of the Tudhope is behind the "Everitt."

"EVERITT" Fore-Door Touring Car.

Price of Standard Touring Car $1450. Price of Roadster $1450. Price of Fore-door Touring Car $1500.
F. O. B. Orillia. (Tops and Windshields extra.)

The Automobile is the New Factor in Profitable Farming.

Every country dweller NEEDS an automobile. Needs it so much that it is poor economy to go without. Farmers have learnt this in Kansas. In Canada, the automobile is doubly valuable.

Emergencies such as calls for the doctor—or for repair parts during harvest can be quickly taken care of. Auctions, stock sales and the markets for fifty miles around, are available for the farmer with a car. Fewer horses may be kept. The farmer with a car can do more in the day. He saves time mornings in milk deliveries to the cheese factory, and evenings in going to post office or store. Sons stay on the farm-with-a-car because they can enjoy town life in the evenings and still live in the country. The most dependable car for out of town use of all is the "Everitt."

The "Everitt" is a Simple, Complete, Understandable, Faithful Machine, with Few Ills to Cure.

In the "Everitt" at $1,450.00, you get a $3,000 grade of material and construction, with the wear and strength of a costly car.

Owing to the few and simple parts, easy to understand, the actual cost of the complete car is what it is—low. Not by skimping quality, but by reducing complexity of parts, is the "Everitt" possible at $1,450.00.

Every part in the "Everitt" is made from best quality metal, and the important working parts are made true to 1-1000th of an inch. The whole car fits together true to a hairs-breadth, and two "Everitt" cars may be taken apart and rebuilt with interchanged parts into two perfect cars.

This is important to you because your "Everitt" will not get "ricketty" or rattly. It is too exactly and perfectly fitted together. As a result you get long wear in a vibration-proof construction. You cannot get a better-built car.

The "Everitt" Motor is the Easiest to Take Care Of. In Fact It Takes Care of Itself!

In the "Everitt" we build a motor unique in strength and simplicity. It is made to prevent motor troubles and to keep itself right. It removes the last objection to a doubting car buyer, for any owner can keep it running with very little study.

Motors are driven by a gas explosion in each cylinder driving the shaft attached to a crankcase which holds the shaft bearings. You will understand how the explosion tends to tear the cylinder loose from its attachment to the crankcase instead of actually turning the shaft. This is the cause of trouble in every type of motor except the "Everitt" because any "give" puts valves, pistons, etc., out of line and 50%, or more, of your power is wasted.

But in the "Everitt" all the cylinders and the crankcase itself are made in one solid piece. There can be no "give," and consequently every moving part keeps perfect alignment as long as the car itself lasts. Your "Everitt" runs right, because every bearing is in its true position. This applies to the valve action especially, which is timed perfectly.

The motor is as simple as it is sure and perfect in action. This is a great consideration in a car for country use. "Everitt" simplicity makes the motor easy to understand. Every part is also easily accessible and individually adjustable.

The "Everitt" Carries More, Costs Less for Running, Gives Long Service.

The "Everitt" is built for a lifetime of hard service on country roads by men who know Canadian climate and road conditions. We know how well the "Everitt" is built because it is not an "assembled" car—every part, including the car body, is built into the "Everitt" in Orillia. No other Canadian made car has this advantage.

The "Everitt" has stronger wheels, axles and side frames, with a bigger tonneau—roomier, with wider seats.

"The "Everitt" is not a heavy car—its 2,000 parts weigh less than the 4,000 parts of other cars yet they are not one whit less strong. Our reputation depends on the strength of the "Everitt" so be sure we watch that. But by saving unnecessary weight we make sure of three important things: 1. Lessen tire wear. 2. Lessen gasoline consumption. 3. Lessen wear and friction on the whole car.

You get more mileage and greater carrying capacity for the price than in any other car. In the "Everitt" your dollar gets you the most it can buy in all the service essentials you should look for in your car.

Do You Still Hesitate About Getting a Farm Car?

Look at it as the Kansas people did. Practically every farm there has an automobile. It cuts out the need for one or two extra horses, which are idle in winter. This means $100 or $200 saved in feed every year.

This saving does not work out with a "cheap" machine, a non-dependable car, a car that needs repairs. It does work out for you with the "Everitt." Above all, the pleasures of safe, trouble-free, inexpensive motoring are yours, in full measure, with the "Everitt."

Write Us for the "Everitt" Catalogue To-day. Get Demonstration from Nearest Branch House or Dealer.

The catalogue will tell you more particularly about the car, and how well it is built. Remember the extra market you can reach, the time and money you save, the speedy transaction of country business it permits, and the comfort and sociability it adds to your life. These are great benefits. Let us hear from you. A post card will do.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their **cash** purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. **White's Honey Balm.**—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

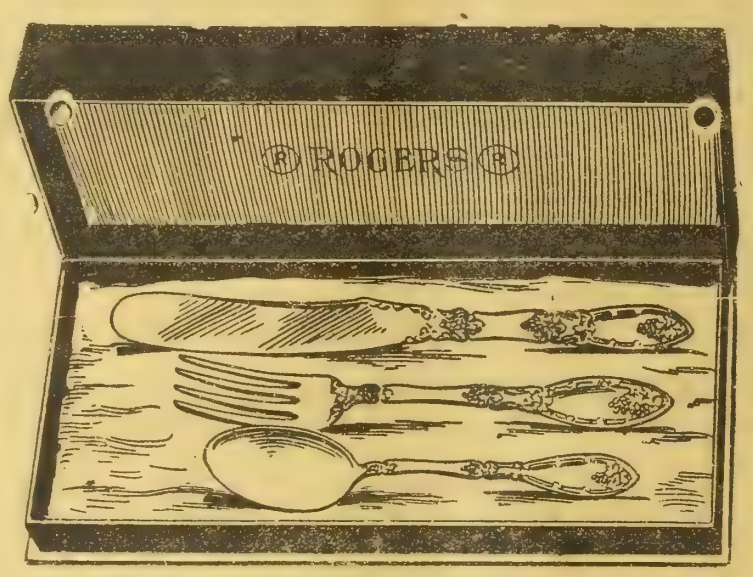
Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—**McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. THE LEADING BREEDS OF SHEEP

Their Origin, Development and Characteristics.

The Dorset.

By B. J. Spencer, B. S. A., Ottawa.

THE Dorset Horn is one of the oldest of the British breeds of sheep. It inhabited from a very early date the fertile counties of Dorsetshire and Somersetshire, situated in the southwest of England. The home of the breed is diversified by hill and dale affording thin chalk highlands and rich clay slopes and valleys. The original Dorset sheep was a large, rather coarse, long legged breed with wonderful powers of maturity. Both sexes have retained horns from the earliest years until the present day. They belong to the medium wool breeds, but unlike most of the others, possess white faces and legs. Efforts to improve the breed by means of out crosses proved unsuccessful, although, according to authorities, both Leicester and South down blood were used. While great improvement in form and early maturing has been accomplished in the Dorset sheep during the past quarter of a century it has been effected entirely within the breed itself.

The Dorset surpasses all other breeds of sheep in breeding qualities. Unlike other sorts the ewes may be bred at almost any time of year, and it is not uncommon for ewes to produce two crops of lambs within twelve months. In England it is not uncommon to find Dorset lambs on the Smithfield market at Christmas, when thay command fancy prices. A number of breeders both on this continent and Great Britain aim to have autumn lambs, some as early as September, although many prefer not to have them earlier than January. The Dorset ewe is a most excellent mother, producing seldom less than two lambs and not uncommonly three. She is a very copious milker and when well fed her lambs go forward at a very rapid rate. For this reason the Dorset fills a special field as a producer of what are known as 'hot house' lambs, which frequently dress from 40 to 45 pounds each at four months old.

Dorset Horned Lambs.

Delaine Merino Ram.

In general conformation the Dorset is of the mutton type, approaching that of the Southdown more nearly than any of the other breeds. It is larger than the Southdown, being almost equal to the Shropshire, and it has less symmetry than either of these sorts. The aveage weight of mature rams is about 220 pounds and ofewes about 170 pounds.

The wool of the Dorset is much like that of the Shropshire in quality. The fleece is quite dense, very white and elastic. The crown and jaws are covered about the same as in the Southdown. Well bred rams clip about 10 pounds, and ewes from 7 pounds to 8 pounds of unwashed wool.

The horns of the Dorset curve gracefully forward rather close to the jaws. They are small and flat in the female, but considerably longer, stronger and more angular in the male and curve spirally outward from the top of the head.

As a crossing or grading sheep the Dorset stands in high favor in the United States, more particularly where Merino grades exist. They impart their fecundity, vigor, excellent milking qualities and thick mutton form to their offspring in a marked degree. On account of their horns they are not well suited for crossing upon hornless breeds. If used at all for crossing with the latter sort the Dorset should occupy the female part of the union. Dark-faced lambs produced in this way meet with a readier sale than the lambs of pure Dorset breeding, and when fed for the showring they frequently win prizes in the classes for grades and crosses.

Until about 1885 the Dorset was little bred outsideof its native counties. During recent years small flocks have been established throughout other portions of the British Isles. They were imported to Canada as early as 1885, and to the United States in 1887. There are now a number of well kept flocks in various parts of Canada and many in the United States.

The Merino.

While the Merino has made great progress in the American republic it has not become a popular breed in this country. In Canada, as in Great Britain, a sheep has to possess at least a fair degree of mutton quality in order that it be taken up either by the breeders or the general farmers who keep a few head of sheep. On the ranges, however, the major part of the foundation stock is Merino, and though the mutton ideal is predominant over Canada as a whole, there are evidences that there will continue to be periodical, if not steady, reversions to Merino blood as long as open range is available. This is not due entirely to the superior herding qualities of the Merino, but to the demand of our growing manufacturers for a grade of wool above coarse or medium. Range wools have greatly increased in value within recent years. This should encourage the progress of sheep husbandry, and in this work the Merino will perform an important part. While our interest in the sheep business has been up to the present almost exclusively concerned with the meat side, it must be remembered that mutton is only one, and not the most important one, of

our meat products, while wool is a characteristic and peculiar product and it is on the wool side that we should expect to see general improvement in sheep husbandry secured.

The Merino is a fine-woolled sheep. It is known to have been bred almost entirely for its fleece since early in the Christian era. For a number of years attention has been paid to the mutton qualities, but as a meat-producer the Merino ranks in sheep no higher than the strictly dairy breeds in cattle. It is quite conceivable, however, that the introduction of the Merino families of sheep to the rich grasses and more rigorous air of the upper temperate latitudes will be attended with an improvement in fleshing qualities and general rotundity of form.

The Merino is of Spanish origin, but large numbers have been so long bred in Germany and France that certain varieties are now looked upon as belonging to these latter countries. For many years importations from various European countries have been made to the United States, where they are bred in more or less distinct classes. These are known as the American, the Delaine and the Rambouillet. The American or Spanish is the smallest and lightest in weight and are still bred almost entirely for fine wool. The Delaine is a heavier bodied sheep with fewer or no wrinkles and of varying uniformity according to the view point of breeders as regards the relative importance of fleece or flesh. The Rambouillet or French Merino is the largest of the breed having been bred and fed for mutton production for many generations both in France and the United States. Weights of individual rams are recorded as high as 400 pounds, and fleeces as heavy as 60 pounds. These, however, are quite exceptional and abnormal. It is probable that such a ram was loaded to the utmost extent with fat and such a fleece with oil or yolk and dirt.

Merinos are reared in large numbers in Australia, New Zealand and Argentine, but as already stated their popularity in North America is chiefly confined to the United States, where some thirty or forty years ago about 95 per cent of the sheep were from Merino foundation stock. In recent years the English breeds have been so rapidly introduced and so numerously bred in the United States that the ratio is greatly changed in favor of the mutton sorts. Over the western plains mutton rams are being used almost exclusively until thousands upon thousands of sheep and lambs that reach the large United States markets bear one or more English crosses upon Merino foundation. Lambs bred in this way readily partake of the mutton form, and when well fed frequently top the market.

From time to time small flocks of pure Merinos have been started in Canada and a small number are being perpetuated in their pure state at the presnt day, but only as a foundation stock for grading purposes has this breed reached the Dominion in any considerable numbers. To stock up ranges in the western provinces low priced Delaine ewes with some admixture of Rambouillet blood have been imported in large numbers from Montana and other western States, and these are being graded up with the rams of the mutton breeds. Under range conditions the young stock matures slowly and the great bulk of the mutton is disposed of as one, two and three-year-old wethers. Few of the lambs are sold off in the fall for immediate killing, but during the past three seasons several thousand head have been fed through the winter on hay and on screenings at elevator centres and have come out in excellent condition for the late winter and spring trade.

The Merino as a breed is among the lightest registered sheep, the average ram weighing from 150 to 200 pounds, and ewes from 90 to 130 pounds, but among the Rambouillets as high as 200 pounds in ewes and over 300 pounds in rams are occasionally met with. The breed has proved itself adaptable to a wide range of conditions, doing about equally well on sparsely clothed hills and fertile plains. It withstands crowding and neglect and travelling long distances for food better than other classes of sheep. For these reasons the Merino multiplies well in large bands under range conditions where individual attention cannot be given to the members of the flock, though it is not as prolific by habit as are the English breeds.

TAIL WORM AND LAMPAS.

That cruelty is often due to sheer brutality our police court records very plainly probe, and individuals witness every day cases of injury to animals, deliberately caused, which never find their way into the public prints. But it is probably accurate to say that in the mass there is far more suffering caused to animals of the farm by unintentional cruelty, the result of heedlessness, ignorance and superstition, than is due to any hardness of heart and contempt of the rights or feelings of the lower creatures.

This is true not only in regard to errors of management, which produce disease that is, perhaps, rarely traced to the real cause, but also in the remedies applied in cases of illness. Some of the old farriers' receipes are terrible concoctions, and these receipes, handed down from father to son, are treasured up by carters and stablemen as precious possessions, and survive all the ridicule cast upon them in the public press and by the qualified veterinary surgeon who so often has them brought to his notice. In the main these are not so much dangerous and evil in their effects as foolish—thanks to the wisdom of the country chemist, who often exercises his own discretion in making up receipes that he does not like to refuse to accept. The cruelty, here, is due rather to the substitution in place of the proper treatment of something which can do no good. But the same thing cannot be said for the surgical treatment adopted, which is often really barbarous—cruel, not only in the unskilful manner in which the operations are carried out, but still more cruel because they are sometimes not only unnecessary, but absolutely harmful.

We propose in this article to refer to two practices which we fear, are still common in certain districts.

WORM IN THE TAIL.

One of these has relation to an imaginary disease called "worm in the tail." A cow is found "down" after or before calving; she is examined by a "cow doctor" or some employee supposed to be clever in the treatment of stock, and he solemnly announces that he has found a soft spot in her tail, that there is a "worm" there, and that its removal is necessary for the cure of the animal. She is pronounced "tail-split," "tail-soaked," or as suffering from "tail-ill," but the most common name used is "worm in the tail." The "doctor" proceeds to operate. He makes a slit in the tail, probably with a dirty clasp knife used for all purposes, and removes or pretends to remove the worm. In reality, if he takes away anything, it is a portion of the tissue. He then applies salt, garlic, or it may be cayenne pepper or turpentine, or some other irritant to the wound, binds it up, and states that all has been done that is possible!

It really should be unnecessary to point out the absurdity of such ideas, but they persist, and we want to say emphatically that there is no such disease as "worm in the tail." No worm has ever been removed from an animal in such a case, and the form of paralysis from which the unfortunate animal is suffering has no connection whatever with the tail. If owners would think for a moment of the fact, of which they are perfectly well aware, that the tails of various animals can be removed in whole or in part without affecting their power of walking about, however much the removal may cause suffering in other ways, they would recognize the foolishness of supposing that a mere local injury in such a part could rob a cow of its power to rise. What the animal is suffering from is a nervous disease or weakness due as a rule either to parturition or to the bodily conditions while carrying the calf. If allowed to rest and treated as advised below, nine out of ten, probably even a higher proportion, would get on their feet all right.

Unfortunately, however, it does sometimes happen that the severe shock caused by this barbarous operation causes the patient to make a desperate effort, which results in her getting on her feet, and when this occurs the treatment is glorified. Past failures are all forgotten, the operator's reputation is increased, and the spectators are more convinced than ever of the truth of the legend of the "worm in the tail." The facts that the operation generally has no effect, and that the cow so brought to her feet may fall down again when the reaction comes, do not weigh in the balance.

"Nothing," a clever writer has said, "is more persistent than a popular delusion. Born of error and bred by ignorance, it sneaks into life unnoticed and takes centuries in the killing." Alas! this is true. We have often exposed the delusion in Farm and Home, and offered a reward for a specimen of the "worm", but the story crops up from time to time as fresh as ever, and correspondents have told us that the belief in the "tail-worm" is still widely spread. The curious want of knowledge of their own stock, shown by people who can still hold such a belief is illustrated by the fact that one sympton of the disease is said to be that the suffering cow has loose incisor teeth! A few minutes spent in examination would show them that the incisor teeth of all their cows are loose.

There is no such disease as "worm in the tail," though many animals are caused intense pain by treatment for it. Suitable treatment for the relief of adynamia—which is the name given to the condition known as falling before calving, the falling after calving or so-called milk fever is quite a different matter—is the use of a tonic such as Liq. strychnine P-B. ½ oz., powdered gentian 2 drachms, powdered ginger 2 drachms, in a quart of ale sweetened with treachle, twice daily, and the application along the spine of a gentle stimulating liniment composed of equal parts of turpentine, spirits of hartshorn and olive oil. See that the animal is well bedded, and if she is down for any lengthy period, turn her frequently to prevent bed sores; let the feeding be light, generous and laxative, using roots such as carrots, with bran and linseed cake, and keep her as quiet as possible. No other treatment is necessary, and if any one among your advisers breathes the words "tail-worm" send him off the premises, or at any rate take care that he has no hand in the treatment of your stock.

LAMPAS.

Concerning the trouble called "lampas, lampers, or lampets," Lt.-General Sir F. Fitzwygram says, in his book on horses, that "a brutal practice was in fashion some years ago of burning the palate with a hot iron. This barbarous and useless custom is now, happily extinct." In this statement, unfortunately, the wish is father to the thought, because, comparatively recent records show, the practice of burning for lampas is still in vogue, and we can testify that over and over again has it been suggested to owners who have fortunately hesitated and written for advice. This affords another illustration of the length of time that foolish practices will outlive the demonstration of their foolishness, for no less than eighty years ago a well known veterinary writer denounced the "brutal custom" of burning down the bars with a red hot iron.

The idea underlying the practice seems to be that a swelling which sometimes occurs in young horses' mouths is due to a "growth" which must be obliterated. In the young animal, from irritation set up by the growth of the teeth, or by changes in them, and in the old from irritation caused by the action of the bit or by irregular or broken teeth, the blood vessels in the lining membrane of the palate become congested. The swollen palate becomes level with or even projects beyond the teeth, and there is great difficulty in feeding, which makes itself evident to the attendant, who concludes that the horse's "lampers are down." Perhaps the best remedy is the provision of soft, easily digested food. If the animal is at grass, the condition rarely lasts long, but if he is kept indoors and fed on hard corn it may persist for some time. If a run out is not possible any green food available should be used, supplemented with bran mashes, and generally little more will be needed. At the worst, the only surgical interference needed would be to scarify lightly the swollen bars with a lancet or perfectly clean sharp pen-knife, so as to draw a little blood. This will relieve the congestion, and if a dose of physic and a few alterative powders are given the animal will soon show by feeding properly that all is right.

Unfortunately, some of the old farriers' books which still linger on the book shelves in country districts, prescribe cautersation. This would be cruelty even if performed by some one possessing skill, as those who stop to think of the delicate character of the palate will understand, but carried out as it often is by unskilful individuals it deserves to be called a barbarous operation and anyone who inflicts it upon a poor animal deserves severe punishment.

Remember that lampas is a mild ailment requiring merely cooling

medicines and at the most a trifling blood-letting and that burning of the palate is cruel and absolutely unnecessary.

The operation for lampas is, moreover an illegal one, and recently a farmer and a blacksmith at St. Neots were each fined One Pound and costs for performing it.—The Farm Yard Series.

Boosting the East.

The Maritime Merchant observing the efforts of The Kings County Record, of Sussex, N. B., to discourage New Brunswick farmers from going west, asked its editor Jas. D. McKenna, to write something for our columns regarding the policy of his journal in a matter of this kind. In responding Mr. McKenna wrote:—

"I think I can almost convey my policy in a single sentence: The Record believes in the East and does not lose an opportunity to say so."

"As editor of The Record I early conceived the idea that there was altogether too much "West" in the columns of the Maritime papers, and being convinced of that, I resolved that the columns of the Record would be closed to free advertising of western towns and the space devoted to boosting New Brunswick and the Maritime Province. The result has been gratifying. Many expressions of appreciation of our attitude have come to us voluntarily, and we believe that in the county of Kings, at least, we have done something to fix upon the minds of our readers the many advantages of their home community. We have endeavored week in and week out to divert attention from the far away green fields and fix it on what we conceive to be the more beautiful and greener acres of Kings County.

"The Record does not discount the West or its possibilities, but it has, and does maintain that a young man who is willing to work has as good opportunities open to him in New Brunswick as he will have on the prairie.

"We never seek for men who are overflowing with admiration of the West. We are not interested in their views. When a man wishes to talk to us of the West we give him a most attentive hearing and then forget about it. We do not follow the example of some papers and give a lot of free advertising to some almost unheard of section somewhere.

"But when a man comes to us and tells us that he has been in the West and that the Maritime Provinces are as far ahead of it as day is ahead of night (and there are many of them), we take in every word he has to say to us and we publish it in the Record. We also feature the interview and give it a prominent place on a good page. We want all of our readers to get as much as that sort of thing as we can give them, and we firmly believe that other papers of the Maritime Provinces can well follow suit.

"And our policy is not wholly unselfish. Every newspaper man, who, through his advocacy of the West inuuces a subscriber to locate there, cuts off, sooner or later, a patron of his journal. Moreover, he removes a good customer from the vicinity of some good advertiser, and a publicity seeker only thrives on sales. Then why build up newspapers in the West at the expense of Eastern journals? The thing is so absolutely closed to argument that we cannot imagine what induces the newspapers of the Maritime Provinces to waste so much valuable time and space to defeating their own interests.

"Take the harvest excursions for instance. How many young men have been induced to locate in the West through this underdrain on our population? And has there ever been a proposition presented for the consideration of the newspapers of the Maritime Provinces which has been received with such apparent joy? Publishers have tumbled over themselves to give the scheme all possible "free advertising." Barnum in his palmy days never dreamed of such a bonaza. It has been the softest thing in the annals of newspaperdom and withal the owners of so many journals of the home and fireside have not only been doing it "free," but have been paying for the privilege by removing from their immediate vicinity good customers and worthy citizens.

"Last year the newspapers of New Brunswick would have none of it. Led off by the St. John Telegraph the weekly press advised readers to remain at home. The disadvantages of harvest excursions and their discomforts and dangers were pointed out forcefully in editorials and newsparagraphs. What was the result? There was no harvest excursion from New Brunswick. The days of the "free" boom for emigration are at an end and the Record believes that this is only common sense on the part of publishers.

"The Record has no quarrel with the C. P. R. It will take off its hat to any man or set of men who can work newspapers to the extent that Eastern journals have been worked in the past. The arrangement was a beautiful one from the railway's standpoint, but it was hard on the newspapers. When the C. P. R. or any other railway wishes to take up the Colonization of the Maritime Provinces and apply the same methods in the East as it has in the West, the Record will place at its disposal any amount of space, free of charge. For the present, however, we prefer to look after the section which we serve, and we try to do it 365 days in the year. What is wrong anyway with trying to interest some of the big transportation companies in the Maritime Provinces?

"Before concluding, Mr. Editor, let me express my appreciation of your efforts in behalf of an advertising campaign for the East. We want it badly and it will be one of the best investments that the three provinces by the sea can make."

When Soils Need Lime.

Many farmers have acquired the so-called lime craze and think that lime is demanded by all soils. Although lime is needed on many farm soils, it is not wise to apply it to any soil until it has been determined that this particular soil lacks lime. There are types of soils that may be benefited by liming. In the first place, a soil may, on account of its origin, be deficient in lime to the extent that crops will not thrive upon it because of the lack of this ingredient as a plant food. Other soils may be acid, because of an excessive use of acid phosphate or muriate of potash as fertiliers. In this case the phosphoric acid or potash has been taken up by the plants and sulphuric or muriatic acid as the case may be, set free in the soil. Heavy soils containing a large amount of clay, and also light sandy soils, are greatly benefited by the judicious use of lime.

Lime improves the physical properties of a heavy clay soil by binding together the individual soil grains into larger particles. This puts the soil into better tilth by making the spaces between the particles larger than the spaces were between the individual soil grains. Under these conditions the air can freely enter the soil and promote the making available of plant food, while the plant roots will not be hindered by a close texture and the clay soil will not bake at the surface. The same effect is produced upon a sandy soil, but the result is directly opposite. The grains of sand are cemented together by the lime, but instead of the texture becoming looser, as in the case of the clay, the spaces between the soil grains are closed and the sandy soil becomes less porous and more retentive of plant food and water.

The acidity of a soil is corrected by liming. This promotes the growth of soil bacteria that do not thrive in acid soils, and in this way hastens the decay of organic matter. The popular organisms that grow upon the roots of the legumes are aided in like manner by the application of lime. The clovers, beans and alfalfa will not thrive on acid soils.

Where lime is deficient as a plant food, it must, of course, be added to the soil. It also has a very marked effect upon other plant foods of the soil, such as phosphoric acid, potash and nitrogen in making them available for the use of the plant. Lime also has a very important action upon the poisons excreted in the soil by plants in which the poisons are rendered harmless to other plants that are to be grown upon the same soils.

While liming the soil will produce many beneficial results, the injurious effects of anplication of lime to the soil must not be overlooked. Excessive amounts will hasten the decomposition of organic matter to such an extent that when applied to a light, sandy soil, which is deficient in organic matter, it burns up the humus with a great loss of nitrogen. Limestone containing a large amount of magnesium should not be used, as an excessive amount of this element has a poisonous action upon many plants. Small amounts are not objectionable. Again, potato scab grows best in an alkaline soil, and an application of lime is likely to increase this pest. In many instances the crop of wheat has been benefited by an application of lime, but corn and rye are not benefited unless the soil is acid.

Crushed limestone may be applied to the soil at any season, but burned lime should only be applied in the fall, unless the soil is acid or contains a great deal of humus. Since lime helps to decay organic matter, a good place to apply it would be on meadows after plowing to help decompose the large amount of vegetation that is turned under. The frequency of application depends upon the character of the soil, rotation of crops and the crops grown. Small amounts applied frequently have been found to give the best results. One-half to 1½ tons per acre every five or six years is sufficient, but acid soils require from two to three tons per acre.

The first thing for the farmer to do is to determine, if possible, whether or not his soils need lime. This will require some experimenting on a small scale, or the advice of a soil expert. Try a few loads on a small portion of a field that is to be cropped, and when the crop grows, it will be a very easy matter to tell whether or not the soil has been benefited by the application. If it has not, then the extra expense of liming the whole field has been saved. If it has, then the farmer will feel safe in applying it to the rest of the field. A little foresight and thought along this line will save a good deal of expense and disappointment.—C. H. Spurway.

Hay Cut Too Late.

Riding through portions of the country during the past week, I noticed many hay fields in which the grass had passed the prime cutting point and was still standing, waiting for the mower. There was occasionally a field of clover or timothy and clover in which the clover blossoms on half or more of the plants were turning brown, and in which the heads of the timothy were covered with pollen all ready to be shaken off.

A great many farmers apparently waited until after the Fourth of July to commence their haying. This is a common practice with a good many farmers, but frequently it brings all of the haying too late in the season for securing the best quality of a crop, much of the hay becoming too much matured, too dry and strawy, before the mower gets around to it.

It used to be the rule of the progressive farmer to commence haying immediately after the fourth. Hay was well matured by that time. There were other farmers who let their hay get well ripened before cutting it. Naturally it dries and cures easier and quicker when it is well ripened, but that is not what we want. We want, first of all, the quality which is found in grass, or as much of that quality as possible, and as a rule it won't do to wait long after the fourth of July if one expects to get the most possible of that quality. This is especially true in a dry season like the present. When the weather is dry, grass, like any other crop, will ripen up quicker and likely be somewhat stunted in growth. After it begins to ripen, there is no use at all in waiting for it to get more growth, for if it does add a little more to the length of the stalk it will be very little, and before it is cut, it will very likely lose more in quality.

A great deal of grass is ready to cut before the first of July, however, and every day after it is ready it loses something of its succulent quality. Grass should be cut for hay very much on the same prin iple that oats are cut for hay, before the seed begins to take the strength from the stalk and the stalk begins to lose its grass quality.

It stands to reason that grass which is not cut until the pollen of the blossom is developed so that it is ready or nearly ready to drop off, will, if cut in that condition, contain much of the dry, dust-like stuff, and therefore be likely to be a great deal more dusty as hay than it should be. This is a good reason for early cutting. I hope that some of those who have put off their haying until they have come to some such conditions as these will take note of the results figure out where they could be improved with profit, and plan for that improvement next year.

Loosening the Soil.

Loosening of the soil on the surface forms a mulch which conserves the moistute and also offers the most favorable conditions to pack and store rainfall. The soil is also aerated. The foul gases arising from decaying organic matter are removed and oxygen is supplied to the growing plant roots. Mote than this the fertility of the soil is developed by cultivation.—A. M. Ten Eyck, Kansas, in the American Agriculturist.

THE MARITIME FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Aassociation

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

UOR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

Photographs of farm life, when accepted, will be paid for at the rate of 50 cents each, Communications on all subjects connected with farming and stock-breeding are invited. The publishers will pay a reasonable rate for matter of practical value and for agricultural news. Photos and matter not accepted will be returned on receipt of postage.

RATES FOR CASUAL ADVERTISEMENTS.

2 inch—First insertion 75 cents; 2 inches—First insertion $1.50 3 inches—First insertion $2.25.

Contract rates on application.

SELECT EXHIBITS EARLY.

Within a few weeks the fairs will begin, and the prospective exhibitor will do well to bear the fact in mind as he goes about the harvesting. Samples of sheaf grain chosen before the binder starts will be more satisfactory than those one must take from the bundle. The very choicest products of the farm should be set apart for this purpose, and every farm should specialize on some one line, whether of stock, dairy products, or cereals. The selection of the proper type of material for exhibit purposes is no easy task, and involves much more than a superficial knowledge. The inexperienced exhibitor will find material help in the score cards of the Experiment Stations, which will be gladly sent upon request. Apart from a proper standard of values, neatness goes far toward making a successful showing. Whether the chance to win looks promising or not, fit up an exhibit for your local fair. The desire to win will make a winning farmer out of the man who follows his ideal persistently and with good judgment.

BRAINS AND MACHINERY.

There are two things the judicious use of which will assist the farmer more than anything else in the convenient, economical and successful accomplishment of his labors. They are brains and machinery. I was about to say that it would be difficult to determine which of the two was most important, but I think that no one will be inclined to doubt that brains should have the first place.

Modern machinery is one of the most important things for the successful operation of a modern farm even if it is a small one, but even modern machinery without the directing influence of brains—I had almost said modern brains—will fall far short of accomplishing for the farmer what it is capable of doing. After all, I think I will let that stand—modern machinery and modern brains—for brains with modern ideas evolving from them are needed no more in any other business than in farming in these days.

Although we rejoice, and in a measure we boast that the opportunities and the possibilties of farming are great and splendid in these days, these opportunities are not improved and these opportunities are not developed if farming is carried on as it was half a century ago. Good machinery requires good brains to get good results out of its use, and when the man with brains will use them and will supply himself with good machinery there should be satisfaction and comfort as well as profit in farming.

And after all, this matter of satisfaction and comfort, of pleasure and enjoyment, is an important thing in any business. We were not created simply to work hard; our opportunities for business were not given to us simply to give us the opportunity to labor. Hard labor is not the prime object of our existence, the principal reason why we are living. We have been given the capacity for pleasure, for the enjoyment of the good things of life, and the farmer better fulfills his mission in life if he makes this possible for himself, for his immediate family, and contributes some of the overflow from every farm, to the pleasure and enjoyment of the rest of the world.

In farm work in these modern days there is almost nothing that will so contribute to its enjoyment, even to its pleasure, as well as to its success, like a good equipment of modern tools and machinery. Haying on a farm which is equipped with loaders and unloaders, and where it is hardly necessary for a man to lift a pound with a pitchfork, has almost half its terrors eliminated.

But there are farmers yet who say that the good old-fashioned way of pitching hay onto the wagon and off into the mow, the way father and grandfather did it for nearly a century, is still a good enough way to harvest hay. Well, it may be for some, but there are many who are discovering the principal object in farming is not to see how near one can come to breaking his back with hard work.

The excuse that it costs too much money to buy modern machinery is not a good one now, for it is much more expensive to attempt to do the work without the machinery in these days. The cost of labor would make a great deal of farm work impossible if it could not be done by machinery.

TOLL TAKEN BY WEEDS.

Did you ever stop to think of the tax you are paying to keep up the weed crop ? If the township should level a tax on your crops equal to 25 per cent of the value, you would rebel in righteous indignation. Wouldn't you ? Yet a good many of us permit a stand of 25 per cent of weeds to occupy our fields and think we are doing pretty good farming too.

Why not grow grain or roots, or some other good crop, where that weed tax is now growing ? The weeds give no return. They draw more heavily on the water supply and plant food supply than paying crops. Paying crops and weeds cannot occupy land at the same time. Let us grow paying crops and get profits rather than pay taxes.

Pound for pound, the plant food required by crops and by weeds is almost the same, but weeds are better fod gathers. The greatest difference comes when the question of water arises. Weeds not only require more water but are able to get it From 300 to 700 pounds of water are used in producing a pound of dry matter in our common crops. Weeds require even more. If it comes to a contest as to which will get it, the weeds win.

NEED OF HOME WATERWORKS.

The income from the farm cannot be used to better advantage than in making home life comfortable and pleasant. Indeed, money has little utility if it does not bring those higher things of life that make us better citizens and more efficient workers in the earthly vineyard.

There is no more desirable improvement in our country homes than water under pressure for culinary, lavatory and bath. The expense is so small when compared to the advantages to be had in securing it, that the wonder is why more homes are not applied. It must be that we are not as much interested in the comfort and convenience of the home as we are about the crops and the livestock.

When the weather is warm and dry, the demand for home waterworks is more urgent. The tired housewife finds her strength failing, but she is forced to carry water into the kitchen, often drawing it from a deep well with rope and pulley The laundry work is a problem because water is in convenient and the bath has been neglected. The farm hands also neglect their personal appearance and comfort, since bathing facilities are inadequate

A system of waterworks not only relieves the overworked mother of drudgery, but it affords an opportunity for teaching the children cleanliness and care in their personal appearance and the principles of economic household administration.

The reservoir, power, pipes and fixtures for the installation of waterworks in the country home are not expensive and most of the necessary labor can often be performed by the farm hands. The work of plumbing may be done in wet weather when the ordinary work in the fields can not be done.

Times have changed and the standard of living increased. Every mother has an ambition to rear her children under healthful environment and she should have the co-operation of her husband in making home life elevating. To get the most out of farm life and to enjoy the comforts of the home, nothing contributes more to this end than a home waterworks system.

ABANDON THE COUNTY FAIR.

No, never let such a thought become the subject of serious consideration with any board of fair managers. This can only be the result of hasty decision and should be reconsidered. Because there has been unfavorable weather conditions for growing certain crops is not sufficient reason why the educational influences of the county fair be withdrawn for one year. There is sufficient merit in any good county fair in the exhibition it can make in other departments if the entire agricultural products department be closed, owing to crop failure for the present season.

The live stock department, in its various branches, will almost make a fair by itself, or should. Then there are the machinery, the mercantile exhibit (made up mainly by the enterprising merchants of the towns), the fine arts, textile fabrics, dairy, canned goods, bees and honey, poultry, the circus and scores of amusement features that are always present to help make people cheerful and happy. There is no good reason why the county fair be called off, as has been announced by several associations in various parts of the country in various states.

There is a social feature that the county fair is able to exert in all communities that is worth much more than all the trouble and expense of conducting the fair. It will never do to lose sight of this. This is, in fact, the strongest incentive in the patronage of the county fair. Remove all prejudice, if any exists, from the operation of the fair; work to cultivate opportunities for a good social time; strive to amuse, entertain and at the same time instruct all classes of patrons. It is possible to hold a good fair, a satisfactory fair, and not have an extensive display in all departments or in any department. It depends largely upon the effort of the management in trying to humor and please the patrons. Visitors are quick to discern the attitude of the bosses toward the people; if they are treated cheerfully, pleasantly and courteously as the honored guests of the management, they commence to warm up and feel good. The cheerful side of an ill-humored person, when it gets on the outside, is frequently not so bad, and when it gets the inspiration of other good humor becomes a factor in the general mirth of a happy crowd on the fair grounds. Try harder to please the people, give them more of the attractions and give them a better class than you had last year. If it is not possible to show corn, potatoes, onions, melons and pumpkins, owing to the drouth, give them more of the marvelous feats of the acrobat, the automobile race against time, etc. Keep the county fair alive and in the lists. It is the best advertising your county gets away from home, and its home influence is too well known to urge in this exhortation.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

A Good Stand of Alfalfa.

A good stand of alfalfa is a variable quantity as regards number of plants required per unit area. In a newly seeded field, where plenty of seed has been sown and the conditions have been favorable to start the young plants, as many as one hundred and twenty plants per square foot have been counted. As few as ten strong young plants per square foot fairly evenly distributed may be considered a fair stand—thick enough to leave.

It is questionable whether a very thick stand is as good as a thin or medium stand. Those who advocate sowing a small amount of seed claim that the thinner sown alfalfa starts stronger, will be more productive and remain a good stand longer than that which is sown thicker. One advantage, perhaps, of the thicker seeding on fertile ground, is the less coarse growth of stem, which produces a finer quality of hay than the larger, coarser growth resulting from thin seeding.

Thickening Up a Thin Stand of Alfalfa.

It is sometimes possible and advisable to thicken up a thin stand of newly seeded alfalfa by re-seeding. This may best be accomplished by harrowing early in the spring the field which was seeded the previous fall or spring, sowing a little seed, and covering it with the harrow. The earlier this work can be done the better. The difficulty in starting new plants among the older ones, is that the plants which are well started will exhaust the soil moisture and plant food and shade the younger, more feeble plants, often destroying them, especially if a period of dry, unfavorable weather should occur.

It is not advisable or practicable to thicken up a thin stand of alfalfa on an old field, since the younger plants even if they can be started, will hardly survive the season in competition with the old, well-established plants. The old field which has become weedy or full of grass had better be broken and rotated with corn or other crops for a year or so before re-seeding. In fact, the preferable plan is to seed down other fields, using the alfalfa in rotation with corn and other crops, rather than to attempt to keep the same field in alfalfa continuously.

Cultivation of Alfalfa.

Reference has already been made regarding the importance of thorough preparation of the soil before seeding alfalfa.

In the opinion of the writer three-fourths of the failures to grow alfalfa successfully have been due to lack of soil cultivation and to wrong methods of preparing the seed-bed and sowing the alfalfa. The cultivation of alfalfa after the plants are well established, may also benefit the crop.

It pays to cultivate alfalfa just as it pays to cultivate corn and other crops. The next season after seeding, a heavy straight-tooth harrow or special alfalfa drag-bar cultivator may be used in the spring to loosen the surface soil and, as soon as the alfalfa has become well established the field may be disced or cultivated with either the spike-tooth, disc harrow or special alfalfa cultivator regularly each spring and perhaps during the season after each cutting. By thorough cultivation late in the season, after the third or fourth cutting, it is often possible to destroy many weeds such as crab-grass and foxtail, the great weed enemies of alfalfa.

Cutting Alfalfa Hay.

Alfalfa should be cut for hay when it begins to bloom. Several experiments conducted at different state experiment stations have shown that alfalfa hay has a higher feeding value when cut at an early stage of maturity, about one-tenth in bloom, than when cut in full bloom. It has also been observed that when cut at the beginning of the blooming period the next crop, under favorable soil and weather conditions, starts quickly and there is no delay in the growth of the alfalfa.

It appears that as the alfalfa approaches maturity the young shoots start again from the crowns of the plants. If the crop is not harvested until in full bloom or past bloom, these young shoots may be cut off, thus checking the growth of the alfalfa and delaying the harvest of the next crop. By taking due care to always cut alfalfa as soon as it starts to bloom, it is often possible to secure an extra cutting in a season, above what may be secured if the cuttings are made at a later stage in the growth of the crop.

The leaves of the alfalfa are much richer in protein than the stems, and the leaves drop off and scatter worse in cutting if the plants are allowed to become too mature before harvesting. For feeding horses, however, it is advisable and often recommended to allow the alfalfa to become more mature and to reach full bloom before cutting. The more mature, hay may be fed to horses with less danger of injurious effects which sometimes occur from feeding the immature hay.

Cut Frosted Alfalfa.

Sometimes a severe late spring frost injures the tops of the alfalfa plants, killing the stems back several inches. If this occurs the crops should be cut at once, even if it is only half matured. The new growth will start quicker from the newly cut crowns than from the stems of the frosted alfalfa plants. Also the frosted alfalfa if it is not cut and removed from the field, will injure the appearance of the next hay crop.

Curing Alfalfa.

The most important factor in making good hay, is favorable weather. Hay exposed to excessive rains, especially hay from leguminous plants such as clover and alfalfa, is greatly injured in quality and feeding value. Every farmer knows that hay is injured by rain and dew, which causes it to bleach and mold and takes from it the natural aroma and palatability essential in hay of good quality, but not all are aware that hay that is cured too much in the sun, not only bleaches and loses leaves by becoming too dry but also loses in palatability and often in weight.

When curing hay of any kind, the aim should be to expose it to the sun no more than is absolutely necessary. The curing should take place to the greatest possible extent, through the action of air and wind, as hay cured in this way retains its natural color and other good qualities which make it nutritious and palatable to stock.

The best hay is therefore, made by curing in cocks or in large loose windrows rather than spread over the ground in the swath, exposed to the sunshine. Hay in the swath is also more exposed to injury by rain and dew, than hay in the cock or windrow. On account of the shattering of leaves and the greater tendency to bleach, the loss in curing clover or alfalfa hay in the swath, is apt to be greater than the loss by curing these crops in cocks or in windrows if the work is correctly done.

The writer would especially urge the importance of quality in hay. Good quality, as indicated by the bright-green color of well preserved hay, will readily add a dollar or two per ton to the selling price; and there is an equal advantage to the farmer and much more satisfaction both to the live stock and to the owner, in feeding prime hay on the farm.

Storing Alfalfa.

Hay should preferably be stored in sheds or barns. The grass-hay sheds the rain better than clover or alfalfa, and may be stored out of doors with little loss, provided the stacks are well made and covered. But a good hay-shed when it is needed, is a profitable investment on any farm. When hay is fed on the farm the plan should be to store it in a convenient place so that it may be conveyed to the live stock with the least amount of labor. If possible, the hay should be stored and the live stock fed under the same roof, to avoid the expense of handling the hay a second time and the shedding of the leaves and heads which usually accompanies a second handling.

A new method of harvesting and storing alfalfa is coming into use in central and western Kansas. The plan was first brought to public notice by Hon. J. W. Berry, Jewell, Kansas, formerly a member of the Board of Regents of the Kansas Agricultural College. His plan is to cut the alfalfa as soon as the dew is off in the morning, rake it green and haul it in the same day it is cut, the only precaution being that the hay be free from moisture other than that contained in the green stems and leaves. He stores the hay in the shed, the bottom of which is elevated about two feet above the ground and covered with strips of board or poles with open spaces, allowing free movement of air and good ventilation beneath the mow. The shed is large enough to store a single cutting of alfalfa from eleven acres of ground, and only cover the bottom of the shed to a depth of three or four feet. The hay is spread over the whole shed bottom in an uneven layer, and not tramped but left light and loose as it is thrown in. The second cutting of alfalfa is placed above the first, and the third above the second until the shed is full to the top.

For five seasons Mr. Berry has put up the hay from this field in the manner described above, and each winter he has baled the hay and sold it at an average of two dollars per ton above the market price of good alfalfa hay. Hay stored and cured in this way is greener in color and of better quality than alfalfa put up by the usual methods.

Experiments at the Kansas Station

A single experiment in storing and curing alfalfa by the method described above, was undertaken at the Kansas Experiment Station in 1905. The second and third cuttings of alfalfa were stored in a small shed above an elevated, well-ventilated bottom in layers four or five feet thick, the third cutting being placed above the second, as described above. When the second cutting was stored, the weather was very wet and the alfalfa which was left in the field, was very badly spoiled by the rains, but the green alfalfa which was put in between showers, cured out almost perfectly, showing only a little moldy hay in the centre of the mow. During the harvesting of the third cutting, the weather was very favorable, and this hay cured out perfectly. During the last two years a number of farmers from different sections of the State have reported good success from putting up green alfalfa by the method described above.

Seasonable Notes About Alfalfa

Notwithstanding severe winter killing and the dry, hot summer, alfalfa has again this season given a good account of itself, and has again demonstrated that it is the peer amongst hay crops. The first cutting was well ready to harvest by the week of June 12th. In most cases reports to hand state that it was cut in that week and the week following. The yield has been most satisfactory, averaging about two tons to the acre. The alfalfa has since come on in splendid shape in spite of the dry weather and is fast making headway towards a second crop. In a year like this one, with ordinary red clover so scarce—it having in many sections been almost totally winter-killed, alfalfa hay will be, even more than usual, appreciated by those who have it.

Alfalfa for Seed.

Some farmers are counting on reserving their second cutting of alfalfa for the purpose of obtaining seed. While it is sometimes very profitable as a seed crop, we all should remember that ordinarily alfalfa in Ontario does not produce over two bushels of seed to the acre, and in reserving a piece for seed one loses what hay he might otherwise obtain from the second and third cuttings, and while he may obtain two bushels of seed or more per acre he is just as liable to fail entirely to obtain seed. On this account one is usually ill-advised in trying for seed, and this year particularly when fodders, clovers especially, is likely to be at a premium, it appears to be a wiser course not to save seed, but to take the second and third cuttings for hay.—Farm and Dairy.

Harvesting Alfalfa Without Hand Work.

Most of our neighbors think that we put too much work on our alfalfa when cutting it for hay. We do put a lot of work on our alfalfa, but very little hand work.

We have now used the same method for three years and have not heard of a better one. We start two mowers in the morning as soon as the dew is off, and cut until two or three in the afternoon. We go over the field with the tedder in the afternoon. The alfalfa is raked into windrows that night with a side delivery rake. The following morning the tedder is run lengthwise of the windrows and again in the afternoon. It is left in that condition the second night, tedded the next morning, and

HORTICULTURE

Hot Weather Injurers Fruit.

During the past week weather conditions throughout the Niagara district have been almost intolerable, owing to the excessive heat and drought. For six days(July 1st to 6th inclusive), the maximum shade temperatures each day have varied from 98 degrees to 104 degrees in the shade, which constitutes a record for this portion of Canada.

On the 7th, a welcome change took place as far as the temperature was concerned, but no rain has fallen in any portion of the district except near Niagara Falls, where they had a severe storm, accompanied by a heavy rain for a short period.

Much damage has been done to fruit and vegetables by this unusual hot spell. Berries have suffered the worst undoubtedly. Those who did not have their gooseberries picked before the hot spell had most of them scorched on the vines. In this respect the damage done on this side of the lake was not so bad as on the north shore in the Burlington and Oakville districts, where the gooseberries are later in ripening. Early raspberries have been much affrcted, many patches being hardly worth picking. The berries are so small that it is almost impossible to get pickers to pick by the box, and the growers and their families are doing most of what picking is being done Late raspberries are beginning to ripen, but unless rain comes very soon they will also be a very short crop of inferior quality. Blackberries will be a failure without rain, and black currants are suffering also. Vegetables too are suffering badly. Onions, peas, beets, tomatoes, etc., are drying up and prematurely ripening. Some potato patches are turning yellow from the heat.

The larger fruit, on the other hand, have stood the heat well, and where thoroughly cultivated, have not suffered much as yet, although rain is much needed for them now.

Hay and wheat have been affected, and I see many fields of hay that have been dried out while still uncut, by the great heat. The feeding value of such hay is small, and it is so dry that, in many cases, the horse rake could follow right after the mower.

A report was circulated that the wheat was badly shrunken. On Friday, the 7th, however, I visited several fields of standing grain, as well as some where the wheat was being cut and examined the heads. In every case the wheat, although somewhat short in the berry, was fairly plump and the heads fairly well filled. The straw, however, was short. Oats also are very short in the straw, although the heads appear fairly good. Corn is also suffering from drought, except on very favorable land which has had extra good gttention.

Peaches, pears, plums and apples so far have not been injured to any great extent, and will be average to good crops should rain come before long. Cherries seem to have flourished in the hot weather, and have turned out a splendid crop of very good quality. The prices too have been very good, the shortage in berries undoubtedly affecting the price of cherries materially.

The hot, dry weather has been favorable to grapes, and they are looking very well for a full crop.

LEAF-HOPPERS BAD.

In some places, however, leaf-hoppers are very bad. Much can be done to control this pest by spraying them now with whale oil soap or kerosene emulsion. I prefer the whale oil soap at a strength of 1 lb. to 6 gallons of water. Use a pointed hose and apply to the under side of the leaves.

Pastures are very much burned up and the price of butter is rising rapidly.

St. Catherines reports the raspberry crop badly hurt, and also that tomatoes are affected. Grapes and peaches look well; apples and pears medium.

Near Hamilton gooseberries and raspberries have been scorched on the bushes. Tomatoes and black currants have also been affrcted.

Whitby reports raspberries, blackberries and currants drying up, and even apples are reported injured with the sun. In the vicinity of Glencoe and Appin a very heavy drop of peaches, apples and plums is reported.

A report from Rochester, N. Y., on July 6th, says that some apples grown on a farm near Brockport were baked on the trees by the intense heat of the 5th. Some of these apples were exhibited in a store window in Brockport.

On July 8th there was a large market at Hamilton. There was also a considerable market on Friday night. The warm weather has raised the price of vegetables as well as of fruit. The price of berries stays high and many people will have to go without. The supply of raspberries offered by the crate was very small, and $3.50 per crate was demanded for the best, inferiors going at $3.00. By the quart they brought 15 to 18 cents. Strawberries are done, only a few of very poor quality being in, brought 15 to 18 cents per box.

Celery, tomatoes and black currants made their first appearance and were quickly picked up. Celery sold at 60 cents per dozen, tomatoes at $2.50 per basket, and black currants at $1.40 to $1.50 per basket.

Sour cherries brought $1.10 to $1.25 and sweet cherries $1.25 to $1.50 per basket.

Gooseberries and red currants were 8 to 10 cents per box.

Will Investigate the Fruit Industry.

The Hon. Mr. Fisher has authorized a special inquiry to be made into the fruit growing industry of Canada, under the direction of Mr. J. A. Ruddick, Dairy and Cold Storage Commissioner. Mr. W. H. Bunting, of St. Catherines, Ont., the well known fruit grower, has been engaged to conduct the inquiry, who it is safe to say, is well equipped to undertake this important work. The officers of the Fruit Division will collaborate with Mr. Bunting in this work, as far as their other duties will permit them to do so. He will be assisted also by local officials of the different provinces and districts. The report, which should be a very valuable one, will be available for the Dominion Conference of Fruit Growers, which is to be held at Ottawa some time next winter.

The investigation will be conducted with a view of securing some reliable data respecting:

1. Area and excent of land adapted to fruit growing in the various provinces.
2. Varieties of fruits which have been found to be most profitable and successful in the several provinces or sub-divisions of the same.
3. General trend of the industry towards concentrating the production of large quantities of standard varieties.
4. Difficulties which are likely to be encountered.
5. Methods of production.
6. Facilities of distribution and marketing.
7. Possibilities of over production, etc., etc.

Mr. Bunting will probably begin the inquiry in the Maritime Provinces this week, and it is expected that it will require three or four months to complete it.

Spraying for Oyster Shell.

Unlike the San Jose Scale, which passes the winter in the mature condition, the Oyster Shell Scale is carried over the winter by means of the eggs which are encased in, and are bensath, the hard oyster-shaped shell which is such a familiar sight in many parts of the country. Protected as they are by this hard shell, which is fastened firmly to the twig or branch, it is difficult to get at the eggs with any spraying material. Caustic sprays, on the whole, applied in the latter part of winter or early spring, as they usually are, have not been found satisfactory in reducing this pest to any great extent.

The Lime Sulphur mixture is found fairly useful when applied when the buds were half opened in the spring, but the proportion of eggs destroyed was not as large as is desirable. If, however, the lime sulphur mixture were applied in late autumn or early winter we believe that the results would be still more marked than if used in the spring. At the Central Rxperimental Farm, says W. T. Macoun, a lime wash has been found the most satisfactory remedy. Experiments were conducted in the winters of 1898-9 and 1899-00 with lime washes varying in strength from 1 to 3 lbs. lime per gallon, with such marked results that this remedy has been recommended ever since. Fresh stone lime must be used. One pound to one gallon of water has been found sufficient, but two pounds to one gallon is better. The mixture is applied in the autumn as soon as the leaves are off the trees.

The trees are sprayed twice, the second spraying being made as soon as the first has become dry. the trees being covered from top to bottom. The lime seems to cut away the gelatinous matter which binds the scale to the branch, and before it is time for the eggs to hatch in the spring the scales and eggs fall off through the action of frost, heat, rain and wind. If the spraying has been well done, and the lime good, our experience is that there are few scales left on the trees by the end of May, when the work is done in November. The eggs hatch during the latter part of May, usually during the last week at Ottawa, and as soon as the young are out good results will be obtained by spraying with kerosene emulsion, whale oil soap or any of the other good summer sprays for sucking insects, but as the eggs do not all hatch at one time, several applications are necessary to get the best results.

Our experience has been that the oyster shell scales are most numerous on trees which have been checked in their growth by winter injury or by unsuitable soil conditions; hence, one of the best preventives, and even one of the best remedies, is to endeavor to re-invigorate the trees by good cultivation or drainage.

Cutworms.

Cutworms have been injurious this spring. It has been found that poisoned bait, made of bran mash, sweetened with cheap sugar, or molasses made decidedly green with a liberal application of Paris green, is a very good remedy in a garden. A tablespoonful of this should be put at frequent intervals among the plants subject to attack, not, however, nearer than 12 inches to the plant; for, in case of rain, the Paris green might be washed against the roots, and would injure or kill the plant.

Thorough cultivation is an aid in overcoming cutworms. Pieces of shingle or board, placed at intervals over the garden, serve as traps under which the cutworms hide toward morning and where they can be found and killed. Frequently the depredator will be found within an inch or so of the plant cut, buried an inch under the soil.

Young plants, like cabbage, cauli-

SUMMER COMPLAINT

Is one of the most troublesome troubles of the Hot Summer Days. The Old and the Young, the Strong and the Weak are all affected alike.

DR. FOWLER'S
Extract of Wild Strawberry

Is the most effective remedy known for the cure of

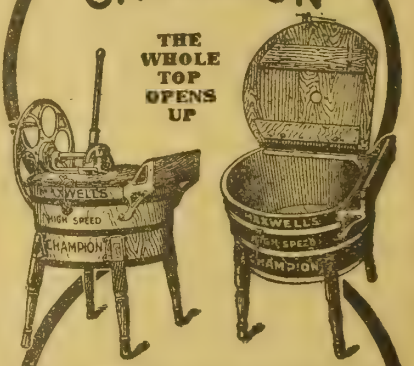
DIARRHŒA, DYSENTERY, COLIC, CRAMPS, CHOLERA MORBUS, CHOLERA INFANTUM, AND ALL SUMMER COMPLAINTS.

This sterling remedy has been on the market for over 65 years and has yet failed to do what we claim for it.

Be sure and ask for Dr. Fowler's and insist on being given what you ask for.

Mrs. C. E. Mills, Teulon, Man., writes "Just a line to let you know that I have a little girl five years old, and during the hot weather of last summer she was very bad with the Summer Complaint, in fact I thought we were going to lose her. We tried everything we could think of but without success. One day one of our neighbors asked what was the trouble with the little girl, and we told him. He advised us to try Dr. Fowler's Extract of Wild Strawberry, which we did. I honestly believe it was the only thing that saved my little girl's life. I don't think there is anything better for Summer Complaint than Dr. Fowler's Extract of Wild Strawberry." Price 35c. Manufactured only by The T. Milburn Co. Limited, Toronto. Ont.

MAXWELL'S HIGH SPEED CHAMPION



We've made it easy to put clothes in and take them out.—The "Champion" has the largest opening of any washer. This one improvement alone is worth the price. There are a dozen others that mean quick, easy washing.

Ask to see the "Champion" and Maxwell's "Favorite" Churn at your dealer's or write us for descriptive booklets.

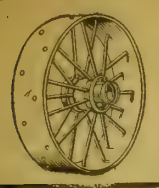
The Worth of a Wagon Lies in Its Tires



Wheel and tire troubles are over for the man who equips his farm wagons with T-K Wide-Tire Steel Wheels. They will carry 25 to 50 per cent. heavier loads in deep mud or over the rockiest roads without delay or danger of accidents. They make farm work lighter: stand any strain; and are proof against breakage.

TK Wide Tire Steel Wheels and Handy Farm Wagons

This is the sort of wagon you want for doing all kinds of work around the farm. It is handy for loading and unloading, will carry as great a load as any team can haul, and because it never needs repairs it is the most economical wagon on the market.

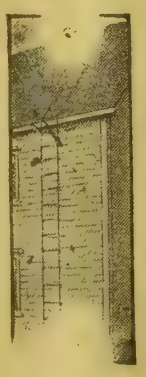
Agents Wanted!

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Stee Ladder.



It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co., Sussex, N. B.

It will pay you to start your letter with the words: "I saw your adv. in The Maritime Farmer."

flower, etc., when first set out in a small garden should be protected by paper, or tin, or a barrier of some sort, which should extend into the ground an inch or so, and two or three inches above the surface. This can be removed when the plant becomes tough enough not to invite attacks from the cutworm. On large acreages, fall powing and thorough cultivation is perhaps the most practical treatment.

Cutworms are always bad the next year after sod, since they normally live in such situations.—F. F. Washburn, Division of Entomology, University Farm, Minn.

Striped Cucumber Beetle and True Squash Bug.

The first of these, a biting insect, and the second, a sucking insect, attack melons, cucumbers and squashes and they are often confounded, both being called "squash-bugs." This is unfortunate, because they call for radically different treatment.

We would suggest planting an excess of seed; for the first named insect, dusting plants with one pound of Paris green mixed with 50 pounds of lime or cheap flour. The beetle can be to a certain extent driven away by air-slaked lime alone, dusting it liberally on or about the plants in each hill.

For the true squash bug we would recommend hand-picking of bugs in the early morning, also hand-picking of the yellow eggs. Destroy all vines after harvesting crop. Plants can be kept covered with light frames of cheese-cloth while small.

A Lawn Without Dandelions.

Many otherwise fine lawns are much marred by dandelions. The flowers are too common to be considered as ornamental and when ripe the white, fluffy heads are very unsightly.

As the dandelion multiplies wholly from the seed—not from the root, as many suppose—the only means of overcoming it is to cut it out about an inch or so below the surface of soil—that is below the point where the leaves sprout. This can be done at any time during the season, but preferably before the flower matures, in order to prevent seeding. Repeated attacks in this way will overcome the dandelion in a short time, and give a chance for a richer growth to the grass.

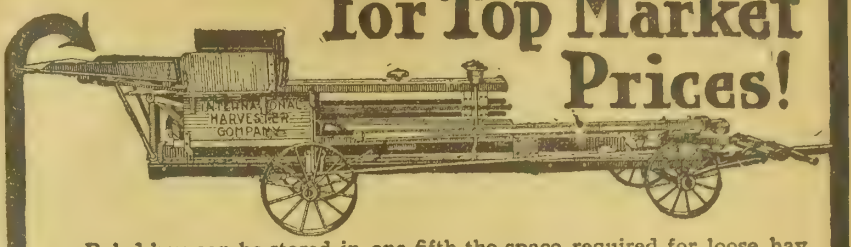
Strawberries

Can you tell me the best time to fill up gaps in the strawberry patch? I put down several thousand plants in May, but have lost about one-third, owing, I suppose to the hot spell we had. What is the best time this year, to replace the lost plants with the runners that are forming on the good plants?

Ans.—Spring is practically the only time to plant strawberries in most sections of Canada. Train the runners along the rows so that they may fill the vacant spaces. Where there is too large a space, filling in might be done some time in August. If you plant in August be sure to do it in damp weather.

Be sure and take a bottle of Chamberlain's Colic, Cholera and Diarrhoea Remedy with you when starting on your trip this summer. It cannot be obtained on board the trains or steamers. Changes of water or climate often cause sudden attacks of diarrhoea, and it is best to be prepared. Sold by all dealers.

Bale Your Hay and Hold It For Top Market Prices!



Baled hay can be stored in one-fifth the space required for loose hay. You can hold your entire hay crop till prices go up—then sell at the greatest profit. The difference between the price you get for loose hay near home and the top price you can get anywhere, for baled hay, quickly pays for an I H C hay press.

I H C Hay Presses

have many points of strength, simplicity, and convenience found in no other presses. They are equipped with a compound lever and a toggle joint plunger, which gives them their great compressing power. A 500 pound pull on the sweep of a 16 x 18 I H C press gives 76,800 pounds pressure in the bale chamber.

The bed reach is only about 4 inches high and very narrow. The bale chamber is very low—easy to reach over to tie the bale.

These presses are reasonable in price and are proved best by years of service. They are supplied to be operated with either one or two horses and the International Motor Baling Press is furnished with a 3, 4, or 6-horse power I H C gasoline engine—a hay press and portable engine in one.

Call on the I H C local agent for catalogue and prices, or, write nearest branch house.

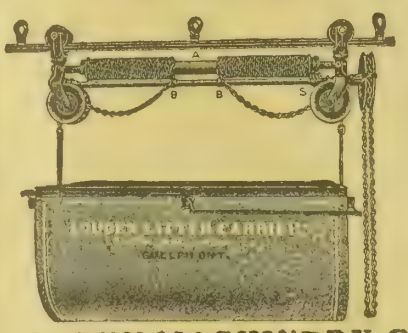
The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy questions concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau and learn what our experts and others have found out concerning these subjects

A GOOD INVESTMENT.



Many, many years ago farmers carried the litter with a fork to the stable door and then pitched it away as far as **they could throw it.**

Then the wheelbarrow was brought into use and it did service for a number of years, when farm help was plentiful and labor was cheap.

Nowadays many successful farmers use Louden's Steel Litter Carrier and it works splendidly. The hoisting gear is simplicity itself, and runs so easily that a boy can readily operate it even when the box is filled to its utmost capacity. This equipment lightens the toil, and makes choring a delight.

DAIRYING.

Returns Per Cow.

Out of 2,400 cows tested last month in Ontario for members of cow testing associations, 895 of them, or over one-third of the total number recorded, gave yields of over 1,000 pounds of milk and 33 pounds of butter fat. Many cows gave over 40 pounds of fat. In sharp contrast are same low average yields, from all cows included in three or four associations, of less than 25 pounds of fat. With butter fat valued only at 20 cents per pound this means that good cows are eaening $3.00 per month more than poor cows. If this average is multiplied by a milking period of ten months it follows that there is actually a difference in the income from two such cows of as much as $30.00 in the season.

These astonishing differences are only brought to light and to the apprehension of owners when they begin to record weights of milk and to take samples for testing. If cows are viewed from a right perspective (a full season's satisfactory production and not a brief, near-sighted glimpse of a record for a day or a week), not one will be retained in the herd that does not return a good profitt; and such common differences as noted above will not be possible in the properly selected dairy herd, each cow selected on the basis of her individual demonstration of profit made. Every dairy farmer will find it advantageous to keep dairy records.—C. W. F.

Vitality in Dairy Cows.

The dairy calf is the only domestic animal that is deprived of maternal attention before being able to care for itself. The first few weeks is a very critical period with the calf, for usually it is thrust into an environment and is dependent entirely upon the kindness, intelligence and judgment of its owner.

Raising calves by hand necessitates maintaining their vitality at all times, especially during the first few days. This is the period when they must depend altogether upon milk and if removed from the cow are often neglected. Whether or not the calf is allowed to remain with the cow for the first few days must be decided according to personal opinions of the owner. However, it is quite necessary that the young calf be allowed the first or colostrum milk of the cow. This milk is peculiarly adopted to the digestive requirements, having a laxative effect which stimulates the first activity of those glands secreting digestive juices.

Likewise, the colostrum milk is very rich in protein material and mineral matter, which are essentially muscle and bone formers, so unless this milk is supplied the young calf will gain strength and vigor slowly. In fact, the vitality of the young animal depends much upon the ease with which its food is digested, the vigorousness of blood circulation and the temperature of its body.

By allowing the calf to run with the cow for a few days furnishes the natural food in quantities as demanded by its system, at a temperature sufficient to maintain bodily heat and uncontaminated by bacteria, all of which aid in the most perfect digestion, absorption and assimilation, hence insures the vitality necessary for natural growth.

The big problem in hand raising of calves is to keep the animal in a growing condition after removing it from the cow. Local conditions and the judgment of the feeder govern largely the course to pursue. It has been my experience as herdsman that most of the failures come from overfeeding. Naturally the calf is greedy and will eat if so allowed. From one and a half to two quarts of whole milk at a feed is sufficient. This will amount to about ten pounds or five quarts, per day, which is plenty for the first two or three weeks, after which the amount may be increased about one quart per day for each additional week.

Over feeding taxes the digestive organs beyond their limited capacity which naturally deranges the whole system, and is often the cause of scours. Again, when the milk is fed at temperatures lower than the animal's body, which in cattle is about 102 degrees F., the vitality of the calf is lowered in its effort to heat the food to a point where proper digestion begins. Hence it is advisable not to feed cold milk until the calf reaches an age where its activity is sufficient to maintain body temperature.

Another thing of importance in calf feeding is cleanliness. The point is often overlooked by some men for the significance of bacterial action is not well comprehended. Nature never intended that milk should be exposed to the air, so precautions are necessary that all utensils be kept clean and free from dirt. This may be done by scalding the feed pails daily or sterilizing them with steam. Too much milk at a feed, too cold milk or milk that has been contaminated with bacteria are the three principal causes which bring on scours in young calves and lower their vitality to a point where other complications set in to stunt growth.

Soiling for the Dairy Cow.

By "soiling" is understood the practice of keeping animals away from pasture and bringing their feed green to them. Soiling is quite common in thickly settled districts, while it is almost unknown in sparsely settled districts.

This is because in thickly settled disteicts land is high and labor is generally cheap, while in thinly settled districts the land is cheaper and labor is higher. In thinly settled districts, therefore, the cheapest thing to do is to let the animals hunt their own food.

As fast as a country becomes developed, it becomes more and more necessary to get the greatest yield possible from each piece of land.

In the case of dairy cows, soiling does this as compared to pasturage. The chief reason is that the ground that produces the green food for cattle will produce a great deal more when it is not tramped.

Every pressure of the cow's feet on the soil compacts it and reduces its power to produce food. Injury results in both dry and wet weather. Sometimes a bare spot in a pasture will remain for several years unproductive. This is avoided by soiling, and the land is made to produce its greatest crop of green feed.

Stil another reason for soiling is the saving of manure. When the manure is dropped on the pasture in dry weather, much of its value is lost before it gets into the ground, but when the cows are kept in one place throughout the summer, the manure produced during that time is as great as it is during the winter. It is then put into the soil of the plowed fields, and practically all of it is saved and can be used on the fields which need it most.

There are still other factors in favor of soiling where land is high. One of these is that crops other than grass can be grown on the land, and a greater amount of matter obtained than in the case of grass.

One of these plants is Indian corn, which can be grown for soiling purposes far north of the latitude where it can be grown for the maturing of the seed. Many who have tried soiling have been able to produce fifteen tons per acre, for either direct feeding or for silage.

This makes it possible to keep on the same land more stock than can be kept where the cows are pastured in the summer and fed dry hay in winter.

Soiling makes it possible for good-sized herds of cows to be kept on the edges of cities where it would be impossible otherwise. In fact, it is one of the directions in which our dairying will be greatly developed in the future.—R. B. Rushing.

Water for the Dairy Cow.

It is very important that the water drunk by the cows giving three or more gallons of milk daily be warmed to about 60 degrees F. Otherwise the cows will not drink as much as they need to keep up a good milk flow. It does not take much ice water to chill a thin-fleshed dairy cow through and through on a cold winter day, especially when she is compelled to walk some distance through the snow or a cutting wind to get to the tank or pond.

Experiments made at the Missouri Experiment station show that drinking water is needed in proportion to the milk yield. That is, a cow giving six gallons of milk a day, needs

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

INTERNATIONAL STOCK FOOD CO., Limited
TORONTO, ONT.

about twice as much water as a cow giving three gallons a day. If the water is too cold to be comfortable if drunk in large quantities, the cow will not drink enough and, as a result, will drop considerably in her milk yield.

When Missouri Chief Josephine was giving about 100 lbs. of milk each day last winter she drunk daily 31 gallons of water. Imagine how she would have suffered if that had been ice water! It was warmed, however, and Josephine did not chill after drinking.

A good tank heater, or some other device should be used this winter to warm the water for the cows.. It will pay.—H. E. McNatt, Dairy Department, University of Missouri.

Milk Making Feeds.

In a test conducted last year the Ohio experimental station endeavored to answer the question: Can silage be made to take the place of a considerable portion of the grain ration usually fed to dairy cows? The results of this experiment, as published in bulletin form are summarized below:

Two rations were fed carrying practically the same amount of dry matter. In one ration over 50 per cent. of this dry matter was derived from silage and less than 18 per cent. was derived from grain. In the other ration over 57 per cent of the dry matter was derived from grain, no silage being fed.

Ten cows, representing five different breeds, were fed these rations from two to four months, five cows taking the test the full four months.

The cows fed the silage ration produced 96.7 pounds of milk and 5.08 pounds of butter fat per 100 pounds of dry matter.

The cows fed the grain ration produced 81.3 pounds of milk and 3.9 pounds of butter fat per 100 pounds of dry matter.

The average net profit per cow per month over cost of feed was $5.86 with the silage ration and $2.46 with the grain ration.

Upon the conclusion of the experiment each lot of cows was found to have gained in live weight: The silage-fed cows an average of 47 pounds per head, the grain-fed cows an average of 57 pounds per head.

Dairy Strippings.

Don't slight the milking, or the cream check will slight you.

Try to arrange your rush work so you can milk at regular hours.

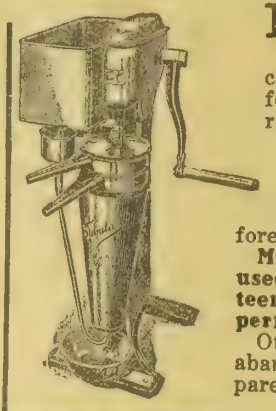
Milk in as dark a place as possible and thus discourage the flies in pestering the cows.

A coarse blanket, made of an old gunnysack and thrown over the cow at milking time will greatly assist in keeping off the flies, thus adding to the comfort of the animals and the satisfaction of quiet milking.

If you are nt supplying those things that aid the dairy cows in avoiding the deterimental effects of this excessive heat you may just expect them to fall off in flesh and dairy production. Plenty of shade, salt and an abundance of pure water are essentials that simply must not be neglected.

If one measly little fly crawls around somewhere on your anatomy and bites you it nearly throws you into spasms. How, then, do you think "Bossie feels" with thousands of these little pests sucking away at her side? And do you think she can come anywhere near doing her best for you under such conditions? It is both merciful and profitable to make use of a good fly repellant at this season.

CREAM SEPARATOR USERS Finally Buy SHARPLES



DAIRY TUBULARS

Others have tried disk filled, complicated or cheap cream separators—and have discarded them for Tubulars. A steady stream of such machines reaches us daily.

There is the best reason in the world for this :

Dairy Tubulars contain no disks—have twice the skimming force of others—skim faster and twice as clean—wear a lifetime—are guaranteed forever by the oldest separator concern on this continent

Mr. J. R. Hammond, Monkton, Ont,, says: "Have used Tubular five years in dairy of twelve to fifteen cows. Have had to replace nothing. Is as perfect as when started."

Other separators are still built on a principal we abandoned over ten years ago. They cannot be compared to Tubulars. You will finally have a Tubular—why not get it first ?

Don't waste time on any cheap or complicated Separator. It is not worth while. Our local representative will gladly show you the quality separator—The World's Best—the Tubular If you do not know him, ask us his name. Write for catalog No. 194.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa** or **Whitish discharge, Ulceration, Displacement or Falling** of the **Womb, Profuse, Scanty or Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**

I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free** of cost, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. COLLEGE RE-OPENS OCTOBER 2nd, 1911

N. B.—Calendar on application.

E. A. A. GRANGE, V.S., M.S., Principal.

Dairy Wisdom.

The farmer can grow cheap foods in the summer and convert them into high-priced butter in the winter, and find a ready market; but he must have fresh cows, good shelter and ample food, and all prepared in season.

Don't stop feeding the dairy cows just because they can gorge themselves on green grass. We furnish them with a little grain and roughage right along through the entire summer, and consider that it enriches the milk-flow, keeps the animals in firmer flesh and saves pasturage.

Ten dollars worth of veal may damage our dairy herd one hundred dollars, so save the choicest heifer calves for milch cows, give them extra care and the best of grain and roughage rations, and you soon will notice a marked improvement along this line.

LIVE STOCK

The Unfortunate Pig.

The pig is perhaps the most misjudged of all our domestic animals. Because, for reasons of health he likes to "wallow in the mire," very much on the same principle that a fowl takes a dust bath, large numbers of people seem to think that he really likes to be continually in a state of filth. Because he is omnivorous and will eat anything, he has all sorts of ill-smelling and unsuitable refuse given him to eat— hog's wash has indeed become a synonym for food that is unappetising in appearance. Though naturally a roamer in the forests, he is generally confined in a small and poky sty, which is badly lighted and affords little comfort; and while he is by nature a lover of warmth he is kept shivering through the cold weather and suffers to an extent which few people realize.

It is well to speak moderately on these matters and to regard them on practical lines. The pig would not be kept at all if he were not a consumer of produce which cannot otherwise be put to a profitable use, and as he is kept for profit, no great expense can be incurred by pig-keepers to whom a balance on the right side of the ledger is an all-important matter. We have, therefore, to consider not what are the ideal conditions for the animal, but what should and can be done under conditions as they exist; and the main text of these notes is that much of mismanagement at present noticeable, while causing the animal discomfort if not suffering, is unprofitable to the owner.

Not a Dirty Animal.—In the first place the pig is not a dirty animal. It is true that the pig-sty offends the nose, but this is because the open court, which is often a perfect abomination, is not cleaned out frequently and properly.. It is, indeed, often so made that it cannot be kept clean and the animal sinks deep into the muck that is allowed to gather round the feeding trough. If we want proof of the cleanliness of the pig, any experienced keeper will tell us that, in proper conditions, the pig will never soil his bedding as so many other animals will do. He will always go as far away from it and from his feeding trough as possible in order to relieve himself, and even little pigs at an early age are not great offenders in this respect.

The pig, given natural conditions, would certainly not be found standing hock deep in foul refuse, or lying on a damp, cold floar. On the contrary, he is a lover of warmth and comfort. Let anyone give his pig a good bed of clean straw, and note how he gets into it, covering himself up as far as possible with the litter. Unlike the cow or horse he is not content to lie on his bed merely, but gets into it for warmth's sake, and if several pigs are lying together they will be found huddled close to each other for the same reason. Is it to be wondered at that, kept in the conditions which are so common, they suffer much from troubles caused by dampness, foul air and want of warmth and sunlight?

Rheumatism.—There is no complaint from which pigs suffer more generally than that which is known as "cramp", but which is really a form of rheumatism. The animal is unable to rise, often crawls to the trough to feed, and there can be no doubt—for he shows it plainly—suffers a good deal. One of the first symptoms of illness in the pig is that he goes "off his feed," and although this is not so pronounced in cases of rheumatism as in other complaints, a slight falling off means a loss of flesh, while as he is kept because of his aptitude to fatten, it is obvious that the main purpose of the keeper is defeated. The pig is not a tractable animal to dose with medicine; besides, medicine is costly, so that the profit would soon vanish if much of it were used. Clearly it is less expensive to provide proper bedding and proper flooring to prevent the trouble than to use costly drugs which may fail to cure. Often they are not effectual, while they may have a bad effect on the flesh, and the same may be said also of the rheumatism itself, as feeders have found when, as the saying goes, they have "killed the pig to save its life."

The chief causes of rheumatism in pigs are exposure to wet and cold, want of exercise, and improper feeding. The first two are inseparably connected with the housing. A miserable tumble-down place, with irregular floor that cannot be properly drained, is often considered good enough for this comfort-loving animal, and as many people who keep pigs do not grow corn and do not care to buy much straw, the bedding is often woefully insufficient. Overcrowding is common, facilities for xercise are not too good, and even when they are present the need for exercise is not recognized.

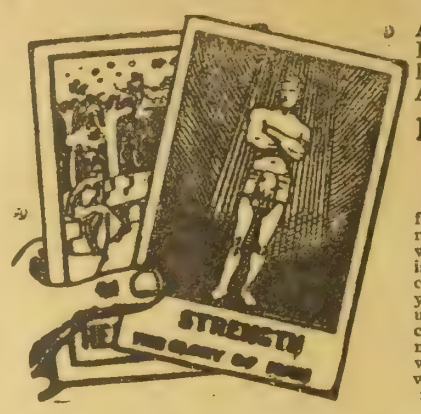
Leaky roofs which admit the rain, foul and close air which affects the lungs and the eyes are common conditions, and these by the way induce another cause of suffering. Pigs, as we have stated, are careful not to soil their bed, and rather than leave their stuffy sleeping quarters to go out into the cold air they retain their water to such an extent that some of the products are re-absorbed and cause illness, sometimes of a serious nature. If, on the other hand, they do go out, chils may follow with the usual consequences.

Another cause of rheumatism is the use of the cold floors of the sty. All these evils are increased when litters are produced just as winter is coming on and the young animals have the most trying season of the year to go through while they are most tender and susceptible. Numerous cases have come under our notice of whole litters suffering from cramp during the winter season, and the moral is that those who cannot afford every comfort to the animal should avoid winter litters if they seek for profit. Profit and comfortable conditions go together.

Perhaps the most merciful treatment for rheumatic pigs is to kill them off, and if they are at all fit for the butcher this is the most profitfitable course. If treatment is attempted, it is absolutely necessary that they should be made comfortable. Give them a well-bedded, dry sty, a full dose of Epsom salts, and then doses of bicarbonate of potash in their food. The food is best cooked, and should, whenever possible, include a good supply of milk. The swollen limbs ought to be swathed in flannel and rubbed with a liniment such as—spirits of turpentine 2 ozs., liniment of belladonna ½ oz., spirit of hartshorn 1½ oz., olive oil 2 ozs. A lot of trouble to take with a pig? Yes, it is—it is much cheaper and better to make them comfortable from the start and prevent the ailments.

Swine Fever.—Pig keepers have been suffering much loss lately from the restrictions due to swine fever. It ought not to be forgotten that insanitary conditions which affect the health of the animals make them more likely to take any infectious illness that may be "about," and it cannot be too often repeated that

A MAN'S BOOK.



A PRIVATE TREATISE, WITH ILLUSTRATIONS, RELATING TO DEBILITY, ITS CAUSE, EFFECT AND HOME CURE.

Let Me Send It to You FREE.

Here is a little volume of cheer and helpfulness which all men, young or old, can read with great profit, it contains much valuable information, of a private nature, is is fully illustrated, and represents the practical knowledge I have gained from forty years of actual experience in giving help to upwards of 100 000 enfeebled, nervous, discouraged men. Just a post card with your name and address and the book will be forwarded free, sealed, by return mail, and with it as well, I will enclose a full description of my new 1910 model Electric.

Health Belt

If you need new strength, this wonderful appliance must appeal to you. It generates a pleasant, exhilarating currant instantly felt, though it can bemade any degree of streng th from mild to strong by simply turning the needle of the current regulator; worn nights while you are sleeping, it pours quantities of health-giving, soothing electricity into your sick, weak nerves you get up mornings feeling bright, strong, full of courage and ambition; it takes all the weakness and pain out of your back; it is a great remedy for your kidneys, bladder, stomach, liver and other vital organs; it cures rheumatism in all parts of the body; it is a courage-giver of the highest order; it brings new strength where weakness exists; it will restore you to vim, rigor and true manhood as sure as night follows day; it makes you feel young and look young; you will live longer for its use; you can throw away all drugs and commence to live as Nature intended you should—a man among men healthy, happy and vigorous. I can send you thousands of testimonals if you care to see them.

"Your Health Belt cured me of Nervous Debility, Lost Vigor, Kidney and Bladder Troubles after all else failed.

"CHARLES L. SNELL,
"Middleport, N. Y."

In all instances I concentrate the full positive current at small of back; it thus enters the system at the nerve and vital centre,

passing thence through the different weakened organs, giving them new life and force. You can get the Belt.

One Million Concrete Blocks For One Farm!

This shows what farmers think of "Ideal" Concrete Blocks and Machines. On the magnificent estate of an Ohio millionaire, one million concrete blocks are being made for building sixteen residences, twelve barns, four 50 foot silos, power houses, chicken houses, etc. — and four miles of concrete fence.

"IDEAL" FACE DOWN CONCRETE BLOCK MACHINES

have displaced TWENTY MILLION BRICKS on this one job alone—because they make the blocks right on the spot—save freight and hauling—save time and hard work—and make more durable buildings that are absolutely fireproof.

An "Ideal" Machine will pay for itself on your farm—and you can make a profit out of it by turning out concrete blocks for the neighbors.

Write us for catalogues and full particulars. 8

IDEAL CONCRETE MACHINERY CO. LIMITED
Dept. M, LONDON, Ont.

"Reliable and Energetic Agents Wanted in Every Locality."

nothing is so unprofitable to the owner than bad housing of stock of any kind.

The Sty.—If a man is going to build accommodation for pigs we strongly advise him to proceed on a definite plan—to have a sty or sties opening on to a small court where the animals can take occasional exercise, on a site that can be well drained. But many a man has to make the best use of what he has or can attend to without heavy expense there are many things that even he can attend to without heavy expense First, make ample provision for drainage, see that the floor can be kept dry, that the sleeping place is not too small so that it will be stuffy, and yet is not draughty and cold; and that a good wooden stage on which the bedding is placed is provided. A handy man can quickly run up a suitable stage which should be removable, and, in default of anything better, old railway sleepers, which can often be obtained very cheaply, may be used. The pig sty should face south whenever possible. How far sunlight and warmth are of value is shown by a report made by one af our leading breeders, who states that when awarding prizes offered by a local authority he found that "in nearly every case where the pigs' were thriving and apparently profitable the sties faced the south." Could anything show more plainly the connection between comfort and profit? Whatever the floor is made of, and concrete and glazed bricks are well spoken of, it should be arranged that there are no puddles, and there should be a gentle slope towards the front of the sty.

A Cruel Practice.—The pig, as has been stated, is not a tractable animal to dose. The work can be best carried out, in the case of liquid medicines, after the animal has been secured—not an easy task—by giving it to bite an old shoe or boot with the toe opened out, and pouring the medicine into this. The harder the animal bites the more likely is the medicine to be swallowed. Sticky medicines may also be plastered among the teeth, and drugs may sometimes be introduced into the food. But we must protest most strongly against the practice, as a most foolish and cruel one, of pouring liquid medicines into the nostrils of the pig. It is a barbarous thing to do, and yet it is sometimes recommended by those who ought to know better.

Food.—The primary cause of many internal complaints is the fermentation set up in the hog tub, into which refuse, often quite unsuitable for food, may be thrown, and in which refuse that may originally be suitable changes its character. It is difficult to avoid trouble of this kind, but there is need of some correction of the idea that anything, however offensive, may be safely fed to pigs, for many cases of serious illness have been traced to the hog tub. One warning is specially called for— to beware of the presence of salt and soda in the wash. Both, in anything like large quantities, are poisonous to pigs and this fact is not to be set aside because some one has given his pigs a little of either and found that no harm resulted. The "wash" in use in may places receives the remains of the dinner plates, on each of which there is probably some salt, the contents of the washing-up pans, and other kitchen liquors in which sodg and salt have been used, and the amount that may unwittingly be given to the pigs in this way is sufficient to cause not only illness and suffering but even death.—By E. Frampton.

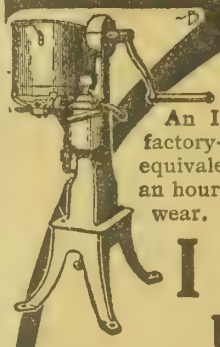
Water for Live Stock.

An abundant supply of pure water should be one of the first things secured in stock farming operations. No one should ever be satisfied with stagnant surface water, such as is contained in ponds, neither should the drainage from the stable or the well be located where it will lots. A period of drough is a good time to secure a well that is to be relied on, for not only is the soil easier to handle than when wet, but there is no excess of water to interfere with sinking the well to a proper depth.

The time lost in hauling water or driving stock to neighboring wells or streams should not be encouraged, for such time represents money, and besides animals so watered are too frequently stinted and neglected with reference to a proper water supply.

In buying a cough medicine don't be afraid to get Chamberlain's Cough Remedy. There is no danger from it, and relief is sure to follow. Especially recommended for coughs, colds and whooping cough. Sold by all Dealers.

Bigger Cream Checks Sure For Years To Come



Just because a separator skims close is not sufficient reason for buying it. Equally important is the question of durability.

An I H C Cream Harvester was put to a year's test at the factory—running steadily for 10 hours every working day. This is equivalent to 20 years of ordinary use, figuring on a basis of half an hour's daily service. Yet in all this time there was no perceptible wear. What better proof of I H C durability can you ask?

I H C Cream Harvesters

Dairymaid and Bluebell

have been paying cow owners big dividends for years. Their skimming qualities are unequalled—their ease of turning—ease of cleaning—and durability are easily proved by the testimony of owners. Why not investigate?

You will find that I H C Cream Harvesters are the only separators with dust-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. The I H C has large shafts, bushings, and bearings. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated.

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes. The I H C local agent will be glad to point out the above features and many others, or, write nearest branch house for catalogues.

THE HORSE.

Size and Quality.

There is a mistaken notion abroad among the uniformed that grit, endurance, longevity and superior quality of bone and feet in such perfection as among horses of less size. There are more soft horses among the big ones than among the small ones, it is true, but the best draft horses need no apologies on the score of those sterling attributes of temper and quality that makes a horse as willing and as able to forge ahead with the work in the afternoon as in the morning, in midsummer as in winter, and at 20 years old as well as at three. A man may choose the kind he wishes. He may take, just because they are big, some coarse-haired, loosely-made, sleepy-eyed round-boned, flat-footed duffers and later be disgusted with their inefficency; or he may demand size with fine hair, sturdy compact build, keen eye, flat bone and wide deep feet. He can find horses with those qualities, and they are the ones to tie to. The vast number of big draft horses that work to a great age and still remain sound and supple furnish constant proof that the usefulness of draft horses is not confined by any such limits as some men suppose.

Draft horses are at their best in work at a walk, but judges and breeders rightly demand that they shall be able tp trot smartly and well. Any day in Chicago one can see draft horses weighing close to a ton trotting along the streets. Perhaps they are loaded with several tons of goods and the driver wants to reach the next corner before leaving the car track at the demand of the clanging gong, or there is a hurry-up call of the delivery of the load somewhere, or it may be that the belated teamster is merely hurrying home with his empty wagon. Sometimes one sees a good shapely chunk, weighing perhaps close to 1,500 pounds, tearing down the street at a gallop with a load of express packages or newspapers. To be sure the horses that remain sound under such driving are not the coarse wooden-legged kind, but horses with big flat bone, legs set mechanically correct, and feet of ample size, deep as well as wide. The fact that big horses can stand such strain should encourage farmers and breeders to set their mark more steadfastly toward quality with size.

There never has been a time when there was a greater opportunity for the breeder of draft horses in this country than now. Both farm and city want draft horses. But men are waking up to the fact that a horse must have many other attributes besides weight. The enduring quality counts in dollars for the breeder as well as in work. The service of a really high-class draft stallion with ancestry like himself, is worth several times that of a horse that is his equal only in size. The owner of pure-bred mares must be especially careful in his selection of a sire if he is to meet the growing demand for horses that are at once nimble, enduring and weighty. Such horses are now being bred. It pays to secure that kind of foundation stock. Pure bred mares of such type have great money-making ability.—Breeders' Gazette.

Don't wash Your Horse.

The practice of washing horses, as a rule, is injurious because it removes the natural oil from the outer skin and predisposes the animal to chill, writes a practical man in the Kentucky Stock Farm. The application of water to a horse's skin increases the heat conducting power of his coat and lowers the temperature of the surface by evaporation and also by conduction, in the event of the temperature of water being cooler than that of the skin. Even in the tropics, washing a horse always takes the gloss off his coat, no matter how vigorously the subsequent grooming may be performed. This fact is certainly a strong argument against the practice in question. If it is imperative to wash, and there is not sufficient help to have the horse rubbed dry, without loss of time, we may, after scraping and going over him with two or three dry rubbers, take him out and exercise him at a brisk pace until he gets dry. We should then walk him about until his circulation regains its normal condition before taking him in. If we can not give this exercise, we may, after scraping and driving him, put on him a good supply of warm clothing, bandage his legs, and leave him thus to dry unhour or less. He should after that der his rugs, which he will do in an be exercised and well rubbed down, so as to prevent his getting chilled. A good plan for getting horses to dry quickly and safely under clothing is to cover the animal's back and loins with straw before putting on a rug, so as to utilize the low heat conducting power of air and to give as little impediment as possible for the escape of moisture.

Fattening Sale Horses.

It is a noticeable fact that horse buyers in Canada are not so particular about having their purchases high condition as is true with dealers ers across the line. Farmers of the corn belt put their sale horses in the stall and feed them for a couple of months before it is expected to sell them. Often the ration is nothing but corn, hay and water, the idea being to get them fat in a hurry. This practice is not followed to such an extent in Canada. A few days ago an extensive horse dealer from the States, who is also a critical judge, was observing what was claimed to be one of the best strings of geldings ever handled by a Winnipeg firm. They were uniform, heavy and in good working condition. "Those horses would not sell in Chicago," remarked the States man. "They are not fat enough. Horses have to be fat to bring long prices in any of the large American markets. Buyers down there will pay good money for fat on horses."

The like for fat commercial horses in the States is also reflected in the breeding classes in the American show rings. Canadian horseman object to showing their horses in as high condition as do the Americans.

Horses, in the final analysis, are valuable for the work they can do. Their mission is to draw loads, and an accessive amount of fat is not only necessary to accomplish this purpose but it is positively objectionable. "Good working condition" has a meaning with all farmers and horsemen understand. That is the condition in which most men like to keep their horses for their own use. Why should it not also be the condition in which they should be sold to a neighbor, the horse dealer or anyone else? With stallions and breeding mares the same arguments will apply. Few stallions are worked and the mares are not kept in the harness, ordinarily, as much as the geldings. There is a normal condition which is natural. If horses carry fat in excess of this it is not only unnecessary but may be highly detrimental in breeding animals.

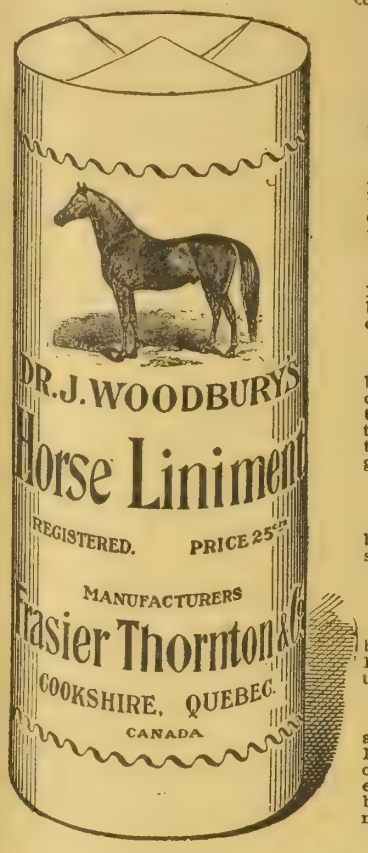
It does not follow, however, that all fat animals will be poor breeders. Much depends on the manner in which the fat was put on. As a rule breeders do not keep the animals in their own breeding studs or herds in high condition. For work horses fat is a hindrance. Fat horses cannot stand the heat neither can they work so well under other conditions as horses in "good working condition."

To be sure, horses that are worked hard will not look as well as horses that have been rested and fed. Most certainly we should fit a horse before offering him for sale. He looks better and a certain amount of fitting will make him better in many ways. The cattle feeder likes to give his them so that they will look their steers a "fill" before the buyer sees them. In the same way the appearance of a horse is improved by fitting before selling. This condition is desirable, does not injure the horse and makes its possible to realize his full value because he looks right when the buyer sees him. But proper fitting" and the "hog fat" condition which seems to be so much desired by American buyers are terms have two distinctly different meanings.

DR. J. WOODBURY'S Horse Liniment.
INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an applicatiou of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.



Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.
Dear Sirs :—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.
Dear Sirs :—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly, C. C. McLEAN.

Truro, N. S.
This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.
NEWTON LEE, Owner "All Right," 5817.

Elmsdale, N. S.
Dear Sirs :—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.
Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs :—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

Dear Sirs :—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.
E. J. ANDERSON, Truro, N. S.

Kingston, Ont.
Full line of veternary remedies in stock including Dr. Bells Wonder, fine blister for Spavins, Ringbones, lumbs or bunches of any kind.

POULTRY.

Good Advice.

The poultry raiser who is feeding the little chicks red pepper, carbolic acid and turpentine should stop all that and bake the feed. Mix it up as if you were going to make cornbread for dinner, leaving out the eggs and sugar. Take sour milk soda and salt, stir in your meal and then bake. When baked, crumble fine, soften and feed the little chicks. Feed them baked cornbread until they are three or four weeks old, and gapes will be a thing unknown in chicks. You can make enough to do two or three days at one time. Save all the scraps of bread, cake and scrapings of all kinds to feed for a change. A large amount of valuable material may be utilized if cooked. Pea pods, string beans, apples, squashes and many other articles, if placed in a pot and boiled until tender, will furnish a quantity of food that is really more serviceable than too much grain. Ducks and geese may be kept at little expense by this mode of feeding, while turkeys and chickens will appreciate the change at once. Turnips and carrots, if cooked and fed to all kinds of fowls, will furnish a cheap and nutritious diet, promoting health and preventing to much fat. In feeding such material no grain is necessary except at night, when whole corn, wheat and oats should be given. One of the most valuable foods is cooked potatoes and sour milk. If this be fed, first thickened with ground oats, it will cause the hens to lay more eggs than when an exclusive grain diet is given. Fowls should have plenty of bulky food if they are to be made profitable.

Saving Summer Eggs.

When we receive 36 cents a dozen for eggs we surely regret selling them for 10 and 12 cents per dozen last summer.

One of our neighbor women carried over 50 dozen in the following manner: The eggs were gathered fresh every day and packed away in salt by first placing several inches of salt in a square box then setting the eggs in rows, the large end and sides not touching. Then another layer of salt and so on until box was filled.

A portion of the eggs were sold to parties whose hens had gone on strike during the holidays, and were found to be fresh and sweet as newly laid eggs. The merchant gladly paid 36 cents a dozen for the remainder.

I intend to save our summer supply this year in the same manner, for I think as I feed the hens I am entitled to the profit. Anyway the cold storage man will not make double on any eggs from my poultry yard.

There is neither fun nor profit in furnishing all the dough for the other's bread.—D. B. Phillips.

Good Laying Records.

A Greene County, Pa., poultryman from 12 Black Minorca hens secured 20 dozen and three eggs during March an average of 20¼ eggs for each hen. Last March was an exceptionally cold and stormy one in Pennsylvania.

J. K. Adamson, of the same county with Rose Comb White Leghorns from 45 pullets produced 952 eggs in March, an average of slightly over 21 per hen.

Those who have never planted oats, rye, wheat or barley for early spring food for their fowls would be surprised at the increase in the number of eggs when they have access to green food.

Many people who do not give thought to their fowls feed too much grain. Grain furnishes heat, causes fat and should not be fed in excess. Protein feed, such as milk, wheat shorts, cotton seed meal, bran and rice polish, should be included.

Penalties of Filth.

At no time of the year are fowls so likely to be negleceed as during the hot summer months, when the farmer is making least out of them and sees smallest prospect of returns. No matter how well they may have been managed the previous winter and spring, interest in them is likely to lag when they lessen their laying. Neglect is most commonly evidenced in careless feeding and watering, and in allowing the poultry houses and yards to become unclean. If the birds have free range, the careless feeding may produce no apparent serious effects; but this kind of luck seldom follows neglect of sanitary conditions.

More than 75 per cent of the ailments with which poultry are troubled are due to unsanitary conditions of the premises. And the foundation of a large proportion of this is laid during the hot months when the fowls should be in most vigorous health and be preparing for the work of the winter, when eggs are high. Chicks cannot thrive in a small, tight, sun-beaten coop, especially where their droppings are allowed to accumulate and the coop is kept in the same place from week to week.

When things are kept clean, not only is the principal cause of disease removed, but the chief source of infestation by lice and mites is also removed. Next to disease, these pests are probably more destructive of chicks than anything else, though they may not be recognized as the agents. Often the chicks fail to thrive simply because they are overrun with lice and mites.

The prevention of such troubles is so simple and so effective that the marvel is that anyone has difficulty in raising fowls at all. The dust bath, especially one of sifted coal ashes and land plaster, will positively prevent any and all trouble from lice, providing the premises are kept clean. Tobacco dust and practically all of the commercial lice powders are good.

Disinfectants, such as carbolic acid or a commercial article, may be used after the premises have been made clean; not before. They are not remedies for the results of neglect, nor do they make it possible for a man to keep filthy quarters and still make poultry pay. The man who thinks to avert ehe penalty due to carelessness by using disinfectants, lice powders or other so-called remedies, is penny wise and pound foolish, for he must sooner or later pay the penalty.—Sylvanus Van Aken in Maine Farmer.

Diphtheritic Roup.

This is one of the most trying diseases to which poultry are subject, and its appearance should cause no small alarm to any poultry keeper. It is a name given to a disease which consists of growths of a cheesy nature in the mouth and throat, very evil smelling, very contagious, and, if not carefully and sensibly treated, very dangerous, causing a great many deaths. As far as the danger is concerned, poultry suffering from this will only die if the growths make their way from the mouth into the windpipe, where it cannot be got at, and so cause suffocation. Apart from that they can be remedied. The way to go about it is to wait until the growths appear to be ripe, and then get a small piece of wood and sharpen it with a pen-knife, and use that sharp piece of wood to remove the growth, which will come away somewhat easily, leaving raw places. These places should now be touched with a weak solution of nitrate of silver, or with any one of the advertised preparations recommended for the cure of canker, and the process should be repeated once a day for three or four days, by which time the growths will cease. Any birds that die of this should be burnt, or buried at least six feet down in the ground, and a thorough cleansing and disinfecting of all house-coops and runs should be carried out. It is also practically useless to get rid of the entire stock and hope to stamp out the disease by buying fresh stock; so contagious is it that it is by far the best plan to try to cure it rather than run the risk of getting new stock, which will immediately be infected with it.—F. W.

Leg Weakness in Chickens.

There are two forms of leg weakness in chickens, the constitutional and the rheumatic. Some birds are weakly from the time of hatching, and unless they are properly fed they are most likely to drop off when they get to three or four weeks old, because they have no stamina in their bodies. The cure for this form of leg weakness is to give them plenty of dry meat and granulated bone meal and things of that sort, and plenty of good wholesome oatmeal. The other form—the rheumatic form—is brought about by dampness, and shows that they need to be better housed and tended. Peat moss dust should be scattered about in their coops, and birds should have a tonic such as Parrish's Chemical Food in their drinking water. Ducklings are very subject to the latter form and they should always be bedded on peat moss.—F. W.

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

Love's Barrier

(Continued from last issue.)

CHAPTER VII.
CONFESSION.

In the midst of his new-found happiness Secretan had not been without sundry qualms concerning Jane's reception of his news.

That it must come to her with some sense of shock was inevitable, since he had not thrown out so much as one hint regarding his interest in the woman he had met in Paris. If only he had spoken to his sister on his return, had told her frankly and naturally about Helen Revell, how much easier would have been his present task! Jane was quick enough and a woman can always scent a love affair from afar.

He remembered as the train sped across the rain-sodden flats of Lincolnshire that it was Jane who had first laid her finger on the tragedy at the Court Farm; Jane who had grasped and made gentle fun of the social ambitions of the mistress of High Ridges. It was Jane, indeed, who tabulated the parish, giving to each uit its particular niche. And he was bound to admit that he had never known her to be far out in her estimate of men or of things.

Secretan had planned several methods of breaking the great news to his sister, selected innumerable cautions and diplomatic sentences which should gently prepare the way, but man like, when she came forward and sat down at the opposite side of the hearth, looking at him with mild inquiry and perhaps some slight apprehension in her eyes, he simply blurted it out in words the fewest and baldest, surely, that ever conveyed momentous truth.

"Jane, I'm going to be married."

She clasped her hands suddenly on her lap, and smiled. Wonder of wonders, she smiled quite spontaneously and kindly! "Of course, I am not in the least surprised," she said.

He drew a long breath, and the tension of his features relaxed.

"Are you not? But how did you guess? I am certain I have never said anything. I have never ceased to wish in the last month that I had given you a full confidence when I came back from Paris, although at that time there was nothing much to tell."

Jane leaned back in the old rocker and gently swayed it to and fro. In her eyes there was a kindly gleam of something like fun.

"I'm not very clever, Claude, perhaps, but any baby could have seen that you had something on your mind. And as things were all right in the parish, we didn't owe any money and there were no particular troubles ahead, it did not require any gigantic intellect to—to arrive at the only solution."

"I was a fool not to have told you dear. I see that now, but you see, I had only met a woman who interested me as no other has ever done, and I thought I had said good-bye to her. When I came back my sole effort was directed to getting rid of her memory, if you understand. I had not the smallest expectation of ever seeing her again."

"Tell me about her Claude—who she is, and where you met her? And don't look at me with such imploring eyes. I've never had a sister and I'm going to be very glad about this one. You know, every sister who keeps a brother's house must get ready in her soul for this moment, or she is a fool."

"I never thought I should marry, Jane, honestly."

"Most men and women who marry think that until they meet the right one; but go on, Claude, remember, I am a woman and simply dying of curiosity."

It was not altogether true. She wanted him to go on speaking, so that she might gain time for the ordering of her own thoughts. It swept over her with an awful wave of desolation that she was the superfluous woman, and that after to-night she would not have any real home.

And in spite of her brave words she knew herself totally unprepared.

Secretan, thus invited, began to talk, and talked well. Still leaning back in the old nursery chair, on which, as babies in arms, they had been rocked to sleep in the old Somerset home, she listened and looked. The looking was even more interesting and convincing than the talk, for Secretan's face was illumined with the passion of his heart, his whole being instinct with the new joy of living that had come to him.

"It will do him good, it has done him good already," said Jane in her heart. "It will give him what he needs, the human and tender touch."

Outwardly she said with a quiet earnestness of feeling:

"Poor, poor girl! I feel very sorry for her, but I quite agree with you that she should not have remained so long with her stepmother. Describe her to me, Claude. Is she tall or short? Has she brown hair or dark? What are her eyes like?"

"She is the most beautiful woman I have ever met," he answered sincerely enough. "But I don't believe I could answer these questions in detail, even to please you. You will have to see her. There is nobody in this parish to touch her; of course, she comes of the best stock. She is a real aristocrat, Jane, and I think it very good of her to have accepted me."

But Jane would not have that.

"A clergyman of the Church of England is a match for anybody, and you know it quite well. I don't want you to abase yourself or to be too humble—but there, what am I talking about? When a woman loves a man she is humble. She will not arrogate anything to herself."

"She is humble enough," replied Secretan, recalling the last good-bye at Colchester station, when Helen had offered him his freedom again, protesting that she was not worthy of anything he had to offer. "It is only half-bred people who arrogate, because, you see, they are not sure about anything. I didn't tell her much about our old home, Jane; indeed, she didn't ask a single question and if she does it will not be necessary tosay anything—I mean to go into detail."

"She didn't ask a single question. Why, I think I should never be done asking. It doesn't seem quite natural, Claude. Wasn't she even interested in Midcar and all the parish folk she is coming to live among?"

"Well, you see, we haven't had much time for that sort of talk. I only saw her for a few hours, and we had a great many other things to talk about."

"And when is it going to be? In the spring, some time, I suppose. We shall have to set about getting something done to the Rectory. That and the spring clean can be done together."

"It's going to be earlier than, that Jane," said Secretan, and the color flushed his cheek. "In fact, the wedding day was fixed for yesterday month."

Jane stared helplessly in front of her. A methodical person who took

FREE ADVICE TO WOMEN

Women suffering from any form of illness are invited to promptly communicate with Mrs. Pinkham at Lynn, Mass. All letters are received, opened, read and answered by women. A woman can freely talk of her private illness to a woman; thus has been established this confidence between Mrs. Pinkham and the women of America which has never been broken. Never has she published a testimonial or used a letter without the written consent of the writer, and never has the Company allowed these confidential letters to get out of their possession, as the hundreds of thousands of them in their files will attest.

Out of the vast volume of experience which Mrs. Pinkham has to draw from, it is more than possible that she has gained the very knowledge needed in your case. She asks nothing in return except your good will, and her advice has helped thousands. Surely any woman, rich or poor, should be glad to take advantage of this generous offer of assistance. Address Mrs. Pinkham, care of Lydia E. Pinkham Medicine Co., Lynn, Mass.

Every woman ought to have Lydia E. Pinkham's 80-page Text Book. It is not a book for general distribution, as it is too expensive. It is free and only obtainable by mail. Write for it today.

Nervous Prostration Sleeplessness Palpitation of the Heart Dizzy Spells

Are all Cured by the Use of

MILBURN'S HEART and NERVE PILLS

Mr. Peter Halstad, Tilley, Alta., writes: "I take great pleasure in writing a few lines to tell you what your Heart and Nerve Pills have done for me. I had a long standing case of nervous prostration, sleeplessness, palpitation of the heart, and dizzy spells. I bought a box of the pills and they did me so much good I continued their use until I had used several boxes and they restored me to health again. They are a great remedy and I recommend them to all my friends."

Milburn's Heart and Nerve Pills are 50c. per box or 3 boxes for $1.25 at all dealers, or will be mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

long views, and who moved in leisurely fashion through life, this breathless haste was not very acceptable, hardly decent.

"A month from yesterday! Why Claude, that hardly gives time far the third time of asking. What is all the haste for? Is there open warfare between Miss Revell and her stepmother, or what is it?"

"Something very like that. She must be taken away from that environment, Jane, at once. If you could see the woman, the other woman I mean, you would understand."

"But surely she could go somewhere else. Hasn't she any relatives who could give her a shelter for a few months. This haste is hardly decent, Claude. It will set the whole parish by the ears."

"I can't help that. The parish must just accept it, dear; but tomorrow, if yod like, you can begin to prepare them."

"And where will it take place?"

"Quite privately, in London, by special licence, probably. There won't be a wedding in the ordinary sense. It is the last thing either of us would desire."

Jane continued to look puzzled and apprehensive.

"There isn't any need to make a fuss, of course," she said slowly. "But such frantic haste will be difficult to explain away. It will make people talk very much here, which is always an undesirable thing where a clergyman is concerned."

"They'll talk whatever happens, and the less there is to talk about, the more they will talk," said Secretan, a trifle irritably. "It is no use arguing the point now. I tell you, the date is fixed, we are to be married on the eleventh of December."

"And come straight here?"

Secretan winced a little.

"We haven't discussed that yet. No, I suppose there must be a honeymoon of some sort, but that must be left to Helen. The circumstances are a little unusual. I want to tell you Jane, that when I went to Colchester I had not the remotest idea of this. I never thought I should propose to her, much less be accepted. It all happened in a sort of whirlwind."

"But you care for her, don't you Claude? You have no other motive?"

"Yes, God knows I care for her. I had no idea there was such a thing in the world. It is wonderful, it transcends everything."

"And she?" said Jane mercilessly. "If she feels like that, too, everything will go right, though the haste will still be undesirable from a prudent point of view."

Secretan hesitated a moment, his brows slightly knit.

"I have to win her yet, Jane. I'm telling you quite frankly. She has accepted me as a way out—yes, that is how to describe it, a way out."

Jane sat forward, and a sort of passion shook her.

"The risk is frightful, Claude; supposing—supposing for a moment she did not learn to care, that you did not win her? The life here is very limited, tolerable only to those who are happy and have a high sense of duty. And if she is a lady, as you say, she will find a good deal to try her. Even I, who am only a plain woman, easily pleased, have had my difficult hours. I don't want to be unkind, dear, or a kill-joy, but—but I think of these things, and I am afraid."

"Oh, you need not be!" said Secretan lightly. "You see, when she comes things will be different socially. They simply are bound to be. Her father was a colonel and a V. C. All the country will come in, and she will have a very good position. I don't see why we should not be happy."

"I am not sure that the country has the power to make a wife happy in her own home,"- said Jane with one of her quiet flashes. "Though it would be very quick to find out, if she were unhappy."

"We'll risk it. We are very good friends, Jane, and, after all, friendship is an essential basis. It is far

better than silly passion, which is soon burnt out. And I will do my best to make her happy. I am setting out to win her. She is worth the winning. I am sure you will think that after you have seen her."

Jane sat back, and her face in the half-light looked rather old and tired. The mother-look was out upon it, as her yearning eyes scanned the lineaments on the boy for whom she had been sacrificed by others, and for whom she had not unwillingly sacrificed herself.

Now her day was over, it was not of herself she thought, but only of him. And the fear in her heart was very great.

"I'm so glad the Hayes are at High Ridges this winter. Of course, we shall be there a good deal. Aubrey will be a friend to her, and though Mrs. Hayes is a trifle impossible, she is kind in her way. Then the Durhams will come. I feel sure Lady Anne will be interested because she has so many soldier sons. Helen will take her place in that set at once.. It will not be to the Court Farm or Watton she will go for social intercourse."

These happened to be the only two houses in the parish at which Jane had been in the habit of visiting regularly, but she passed by the little stab in silence. She was generous-hearted enough to believe that it had not been intended, and Claude had certainly been in the habit of going out a good deal without her, and had left her very much to find her own friends.

"It will be a great change in your life, Claude, and perhaps it will be a good thing. I pray God it will be for your very best happiness," she said simply. "You believe, don't you dear, that I am sincere in what I say?"

"Oh, quite! You have always been the best of sisters to me, and I can never forget what you have done for me here. Helen knows that. She is prepared to be very kind, I can assure you of that."

"Is she?"

These two wards fell with a very curious inflection from Jane's lips, but Secretan went on in the blundering way of men.

"There is no hurry about any change, you know. Helen said very distinctly she wanted you to stop on for a time at least."

"It would have to be a very short time indeed, Calude, if at all."

"Then what would you think of doing?" he inquired anxiously. "You say you have often wished I would marry. If that is so, of course you must have settled in your own mind what would be likely to happen to you."

"Oh, yes, I have thought of all that!" she answered with a frank smile. "At this juncture it happens to be very easy. I shall simply convey myself up to the Court Farm to look after Emmy's children."

"Jane, you won't go there, beside that great hulking brute. Why, he's hardly ever sober. I will put my foot down on that here and now."

"I won't make any difference. I'm your senior, my boy, and don't you forget it! I have been quietly taking my own way all the time I've been here and I shall have it now. I mean to stop Tom from drinking. That and the care of Emmy's boys will fill my life."

"Housekeeper at the Court Farm! I'm not sure if Helen will like that. I shall have to think about it Jane. It's a bit out of swallowing."

Jane rose with a little abruptness which startled Secretan.

"I must go to my Girls' Club," she said as the clock struck seven. "How the time does pass! So the great event has come to pass at last, lad," she said, pausing a moment by his chair and dropping her hand on his head. "I want her full name and address. I shall write to her tonight."

"What about? There isn't any need to write, really. I'm sure she won't expect it."

"I'll do it all the same, Claude, and you shall not see the letter nor the answer, if she does answer. Give me credit for an ounce of common sense. I won't give you away, I promise you, not tell her you are apt to be crusty of a morning, and that the early celebrations in winter you don't regard as a special privilege! She'll find out all your little imperfections for herself. What I'm concerned with is the big thing, the biggest thing of all, whether you are going to be a happier and a better man for this. I shan't be quite sure until I have seen her."

Secretan looked a trifle uncomfortable under the steady gaze. He did not remember having heard his sister assert herself so fearlessly before. He was surprised by her attitude, which, for the first time, assumed experience.

"You make me feel cheap, Jnae, dirt cheap. You ought to have chastened me in my youth so as to make me fit for this ordeal. If I have been crusty in the mornings, why didn'y me aware of it?"

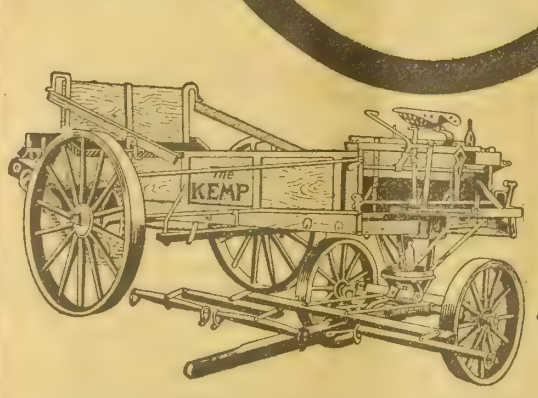
She burst out laughing and turned away shaking her head.

The laugh saved the situation; they shared it together. The moment his sister left the room, Secretan, relieved and incomparably happy, drew to his desk to pour out his soul in his first love letter.

She had taken it much better than he had expected, and with the exception of her slight inclination to over-seriousness, had behaved admirably.

He would ponder on the possibility of her going to the Court Farm, discuss it with Helen, and give a decision later on. He had no doubt in his mind but that Jane would fall in with any suggestion upon which he and Helen might be agreed. Yes, she had taken it quite well, and was not profoundly thankful. So many women were emotional, and it is always difficult to keep the balance true in such a case.

Eminently satisfied with himself,



At least one-third lighter draft

Genuine Kemp Manure Spreader

You can only buy one manure spreader with the Reversible, Self-Sharpening, Graded Flat-Tooth Cylinder—and that is the Genuine Kemp.

Because of this Graded Flat-Tooth Cylinder the Genuine Kemp is at least one-third lighter draft than any other spreader.

There is less friction on the Flat-Tooth Cylinder, because the teeth are wide and graded. On that account only one-third as many teeth are required, which reduces the friction when the manure is passing through the cylinder.

The square or round teeth on ordinary cylinders are not wide enough apart and the manure backs up, chokes cylinder, causing heavy draft.

The manure cannot back up against the flat teeth, and because the flat teeth are graded they will handle and thoroughly pulverize all kinds of manure from the clear gum to the strawy material.

There are many other exclusive improvements on the Genuine Kemp. Our big catalog describes and illustrates them fully. Send for a copy and learn some new facts about manure spreaders.

There would be twenty times as many manure spreaders in use in Canada today if farmers realized the economy of spreading manure with the Genuine Kemp. The Genuine Kemp will pay for itself faster than any other farm machine.

But send to us for catalog That's your first step. We are sole selling agents in Eastern Canada 62

EXCURSIONS TO WESTERN CANADA.

The Grand Trunk Railway System announce that on Tuesday; June 13th and 27th, July 11th and 25th, August 8th and 22nd, September 5th and 19th, 1911. Homeseekers' Excursions will be run from all Stations in Ontario and Quebec to Western Canada, via Chicago and Duluth or via Chicago, St. Paul and Minneapolis, at reduced round trip fares.

The well-known double track line of the Grand Trunk from the East of Chicago appeals to the traveller, and with the superior train service that is offered by this line, including the famous "International Limited" from Montreal daily at 9.00 a. m., and which is the finest and fastest train in Canada, many passengers will be attracted this way. The route via Chicago is a most interesting one, taking passengers through the principal cities and towns in Canada and in the States of Michigan and Indiana. In addition to this a choice of seven lines between Chicago and St. Paul and Minneapolis is offered.

Owing to the great number of Canadians who reside in Chicago, St. Paul, Minneapolis, Duluth and other cities en route, there is no doubt that the Grand Trunk will find many patrons who will take advantage of the opportunity thus afforded them for a brief visit at the stations with their friends.

Canadian citizens are exempt from so-called Immigration Examination, and there is no detention at any point.

Baggage is carried through the United States in bond without requiring any special attention on the part of the passenger. Inspection is not necessary at any of the points at the Border.

Another feature that will appeal to the homeseeker is the comfortable transfer at points like Chicago, St. Paul and Duluth into freshly ventilated clean cars, avoiding the necessity of travelling a long distance in the same car.

In addition to the above routes, the sale of tickets is also authorized via Sarnia, and the Northern Navigation Company's magnificent Steamers across Lake Huron and Lake Superior.

For further particulars apply to any Agent of the Grand Trunk Railway System, or write to Mr. J. Quinlan, District Passenger Agent, Bonaventure Station, Montreal, or Mr. A. E. Duff, District Passenger Agent, Union Station, Toronto.

If your liver is sluggish and out of tone, and you feel dull, bilious, constipated, take a dose of Chamberlain's Stomach and Liver Tablets tonight before retiring and you will feel all right in the morning. Sold by all dealers.

with his sister, and with all the world, his blood rioting in his veins with the prospect of such a bewildering change in the drear monotony of his life, Secretan filled the pages for the woman he loved.

Jane reached her own room where Hannah had already lit the small, cheap lamp, ready for her mistress's dressing. It had gone seven, and the girls would already be gathered in the little clubroom at the lower end of the village street hard by "The Star and Crown." But Audrey would be there to help Lydia Rash. Jane remembered that she had promised to come on that night and sing for them. And, whether or not, she must have a moment for herself.

She sat hard upon the cane-bottomed chair, and looked straightly towards the windows where the cold night wind was ruffling the curtains, and beating the blind cord against the sash. Jane Secretan was thirty-five; looking back or looking forward tonight, she did not know which was the greyer outlook.

The cheerfulness which she had cultivated because she believed that the religion of the Lord Christ included cheerfulness as the first Christian duty had oddly failed her. She put the hands which much homely toil had robbed of any beauty they might have possessed before her face, and the first tears of her renunciation were real and bitter enough.

(Continued next issue.)

Laundry Economy.

Soft water, for use in laundry work, saves soap, clothing, time, energy and money.

Buying soap by the box is more economical than buying it by the quarter's worth.

Removing the soap from the box and piling it in such a way that it will dry, causes it to wash away less rapidly, and therefore to last longer than if not dried.

Having a firm substantial washbench, of a height suited to the worker, so constructed as to hold the tubs securely in position, saves time and energy.

A good stationary wringer, or one which is so made as to be clamped securely to the tub, is a necessity. When through using the wringer, loosen the screws to relieve the pressure on the rubber rollers; wash clean, wipe dry and put it away where it will keep clean until needed. Occasionally cleaning the wringer with kerosene and then washing with soapsuds, rinsing and drying, tends to keep it in good condition.

The ironing-table should be of a height suited to the ironer; not low enough to cause the worker to stand in a stooping position, nor so high as to necessitate the uplifting of the shoulders while ironing.

The ironing pad and sheet should be perfectly smooth, and securely fastened to the table, if rapid, efficient work is to be done.

Irons should be of medium weight smooth and clean. When through using the irons, remove them from the stove and set them on end in a dry place to cool. When they are cool, see that they are clean before putting them away. Irons that are left on the stove day after day are liable to be rough, dirty and unfit to use.

A slip for the ironing holder, made of some coarse white material, is convenient and desirable, because it can be so easily laundered.

Rub the iron, each time it is taken from the stove, on a piece of clean paper or cloth, before using, to prevent the possibility of soiling or scorching the article to be ironed.

IHC WAGONS HAVE STOOD THE TEST OF ALL LOADS AND ROADS FOR YEARS

THE real proof of the strength, durability, and value of I H C wagons is what they have done and are now doing for thousands of farmers throughout the Dominion. Light loads and heavy loads have been carried by I H C wagons, over good roads and bad roads, for so many years that there is hardly a farmer who is not familiar with the high quality that these names on wagons represent—

Petrolia Chatham

Either of these should be your choice if you want to be sure of lifetime service. The quality in both is the highest possible—the result of years of wagon-building experience, and the use of the best materials, shaped by skilled workmen operating with the finest manufacturing equipment.

Petrolia Wagons are constructed of the finest quality wood stock which is thoroughly seasoned by being air dried. The ironing is of the very best. The inspection of each part is most rigid. Petrolia Wagons must be made so that they will live up to the I H C standard of excellence or they are never sent out of the shops.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Be sure to call on the I H C local agent. Get a pamphlet. Let him show you one of these wagons. If you prefer, write for literature or any other information you want to the International Harvester Company of America at nearest branch house.

Forestalling a Headache

A woman who was obliged to drive a long distance for the Saturday marketing said she always dreaded the day because she knew it meant an all-day headache. She set about finding the reason for it and decided it was due to the irregular meals. She left home before noon, eating a lunch before she started, instead of the regular dinner. Before she was through with her marketing she was hardly able to keep on her feet, and she got home she had a genuine sick headache. So, as a wise woman should do, she has a good meal now before she leaves home. As soon as she goes to town she goes to a rest room where she can wash her face and hands and brush up generally. Then, during the afternoon, before she gets tired out with her shopping she goes to a restaurant and gets a cup of hot tea, coffee or cocoa and a substantial sandwich. She says that cleaning herself up before going to the stores makes her feel like a different person and she can do her shopping with more self respect than when she is dusty and mussy from the long ride. And the coffee and light lunch forestall the headache so that she can enjoy her drive home, instead of dreading it. There are a good many such little inconveniences that the country women are putting up with that might be remedied if one would only take the trouble to study them out. Nearly every town has a toilet room somewhere, either in some store, depot or rest room, where women could freshen themselves up after the ride in from the country. It is always wise however to carry one's own towel and wash cloth, or for that matter clean cloths that could be thrown away, would do as well. Public soap, combs and towels are not sanitary, but running water is perfectly safe, and it isn't much trouble to carry a comb and towel.

Good Manners at Home

The presence of good manners is nowhere more needed or more effective than in the household, and perhaps nowhere more rare. Whenever familiarity exists there is a tendency to loosen the check upon selfish conduct which the presence of strangers involuntarily produces. Many persons who are kind and courteous in company, are rude and careless with those whom they love best. Emerson says, "Good manners are made up of petty sacrifices," and certainly nothing can more thoroughly secure the harmony and peace of the family circle than the habit of making small sacrifices for one another. Courtesy and kindliness will never lose their power or their charm, while all spurious imitations of them are to be despised.

Kitchen Cleanliness.

Cleanliness and neatness ought to be watchwords of the kitchen. The cook's hands, nails and apron should be immaculate. Cotton dresses that will bear frequent washings and smooth aprons minus gathers and trimmings—never Mother Hubbard wrappers, kimono sacques or discarded old clothes fit for the rag bag—should be worn for kitchen work. Strange as it may seem, it is possible for a housewife to be clean without being neat. Her stove may shine, her cooking utensils be bright, her hearth and floor scrubbed to snowy whiteness—yet her kitchen table, dresser and closet shelves cluttered with things not put away from the last—or time before last—cooking. Her hair may be frowsy, her dress, though clean, without collar sufficient.

To Husband and Wife.

Preserve sacredly the privacies of your own house, your married state and your heart. Let no father or mother or sister or brother ever presume to come between you or share the joys or sorrows that belong to you two alone.

With mutual help, build your quiet world, not allowing your dearest earthly friends to be be the confidant of aught that concerns your domestic peace. Let moments of alienation, if they occur, be healed at once. Never, no, never speak of it outside; but to each other confess and all will come out right. Never let the morrow's sun still find you at variance. Renew and renew your vow. It will do you good; and thereby your minds will grow together contented in that love which is stronger than death, and you will be truly one.—From "Heart Throbs," in the National Magazine.

A Mutual Partnership.

I know this question of a wife's knowing something of her husband's business is an old one, and yet, as long as young people come on to the stage of action and marry, and the old depart from it, isn't it bound to ever be a new one also to some of these who come last?

I heard a woman say the other day: "I don't know one thing about my husband's business." She was a farmer woman at that. "I don't know how much corn and other stuff he sold last year. I don't know what the cattle were sold at or the number of pounds. He acts so grumpy when I ask him that I keep as far from such questions as possible to. Why, I don't even know who he owes or who owes him."

She laughed as though she did not care much. But I knew she cared a great lot, but not enough to set her head that she would know because it was her right to know. In fact, she could know more than she does. A series of judiciously put questions would let her into the greater part of knowing how much grain is sown and harvested, the price of hogs and cattle as well as number sold, and her husband need not at all times be the one questioned. With this known it is her privilege and right to know the rest by demand, and take nothing like a "no" for an answer. She could manage it if she would.

She married him to be his partner in woe or joy. He endowed her with his worldly goods. If she has sense she has a right to be his partner, and know the business nearly as well as he does. A man may be a good manager, and know how to make good without any help from his wife outside the home in doing so, but he is depriving her of much that is her right to know, and worse yet, should he die suddenly, little as she has ever known of his business, in her ignorance loss irretrievable may come to her when she must take hold of it. I have seen this happen more than once.

I knew one man, and he is but one of many, whose business was not farming at all, and who felt that his business was not one that a woman would care to understand. Sickness caught him in its destructive grip and for weeks he lay close to death. With returning consciousness came the horror of what might happen

FOR YOU—THE BEST CROP INSURANCE IS AN IHC MANURE SPREADER

TO secure the best results, manure must be spread with a machine, because fork-spreading wastes manure, wastes time, wastes energy, and wastes opportunities for increasing the income which a farm is capable of yielding.

In progressive communities you will find that most of the manure spreaders in use bear the I H C trade-mark. Progressive farmers take no chances on their crop insurance. They want absolute assurance before they decide.

Before they bought I H C manure spreaders, they found that they were simple in design—unusual in strength—and remarkably efficient.

They found the power transmitting mechanism the most durable used on any machine, because the beater gear was held in a single casting which prevented the gears from springing out of alignment and cutting the teeth. They found that the long, square, chisel pointed teeth insured positive pulverizing of all manure; that the teeth were long enough to tear the manure to pieces before it wedged against the bars; that the teeth did not rim the bars; that the beater was large enough in diameter so it did not wind. They found that the rollers which supported the apron were large, that the apron moved easily; and that self-aligning roller bearings on the main drive axle not only reduced the draft but prevented the axle from binding, and cutting the axle brackets, a fault not uncommon to spreaders.

IHC Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.

Corn King Cloverleaf

You have choice of these two styles. Each style is made in several sizes to meet every condition.

Don't plant another crop before you see the I H C local agent. Let him tell you all the facts. Let him point out the many advantages of an I H C spreader. Pick out the one that suits you best. Get catalogues from him, or, if you prefer, write nearest branch house for any information you desire.

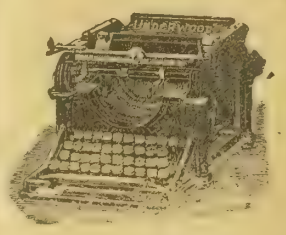
Why Every Breeder should Have a Typewriter.



After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

United Typewriter Co., Ltd..

"What's flour *gluten*, Bud?"
"It's what makes your dough *rise*, Rose."
"Yes"—she encouraged.
Added Bud very sagely:
"Makes it *rise* in the mixer and *expand*
"in the oven. It's the *elastic* part of
"flour—*absorbs* all the water and milk
"—and things."
Rose grew interested.
"FIVE ROSES, said Bud, is exceedingly *rich*
"in gluten. I s'pose because it's *all* made
"from *Manitoba* wheat. Takes up a lot
"*more* water — makes those *fat* loaves —
"lasts *longer* too."
"Saves *money*, doesn't it?" asked Rose.
Bud in a big voice:
"The fat loaf makes the fat pocketbook."
Use FIVE ROSES *always*.
And Rose said YES.

Five Roses Flour

Not Bleached Not Blended

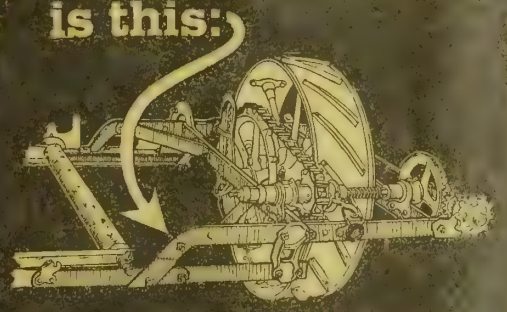
LAKE OF THE WOODS MILLING COMPANY, LIMITED MONTREAL

should he never be able to place his business in such a light that his wife would understand just what was the rights of herself and little child in it—for there was a partner, and it might be possible for that partner to claim nearly all.

Weak and dizzy, he tried to let her into some of the details, and eagerly she did her best to understand. He recovered and since it has been a lesson to both. She knows all that he puts into the business and all that it profits, and he is willing to agree that her advice has helped him in every instance to make better investments in it, and avoid many a risk that showed plainly afterward the loss it would have brought him. This woman is not a particularly bright business woman. She is no better than the majority that could just as well understand more than they do of the business in which their husbands engage.

I know there are women who do not care to know. Such women are shallow, say what you will to the contrary. I know there are husbands who want the sympathy and advice of their wives in their business, and do not get it, but these are rare, for there are more men who do not want to be bothered, and so a large part of womankind who would gladly be taken into this mutual home partnership in the business must go complaining as does the woman I began with.—Ida M. Shepler.

The vital part of a binder is this:



Look into the TRIPLE STRONG backbone of the Number Three. Find out about the Eccentric Sprocket action that makes this the Binder that ALWAYS ties right. Learn about the extra roller bearings and the many other merits that save you money, worry, and time.

Here is the Binder for YOU

Does better work on sidehills than others do on the level

The Frost & Wood Number Three is the binder that actually will work perfectly under any conditions—even on side hills or on lodged grain. No nerckweight, so no chafed shoulders or collar - galls for your horses. Light draft, because fitted with roller-bearings at every friction point.

Handles Long Grain With Ease

Reel is readily adjustable in four directions—up, down, front and back—so that even if the grain is lodged it simply MUST come to the cutter-bar and thence to the apron. Elevators are open at the rear, so the straw has a clear track to the knotter.

Number Three's elevators are force-feed—thus even short grain is gripped accurately — and bundled perfectly. Can't make it choke on heavy straw; can't make it miss on the skimpy spots or in tangled grain. Every bundle tight; every knot O. K.

NUMBER THREE BINDER

G. T., St. John's, Nfld.:—I am a subscriber to your good paper and would ask you to publish promptly reply to the following and oblige.

We have two yearling calves grazing on lawn for few days and they had access to lilac trees. We noticed them eating the bark and leaves and tried to prevent it—next day calves died. Symptoms: Grating of teeth, foaming at mouth, twitching of tail, bellowing, holding head high, staggering gait, going backwards with head upward cast towards one side. Eyes seemed sightless, bowels were not costive. Remedies were given as follows: ½ lb. Epsom salts, ½ tablespoonful ginger, ½ tablespoonful of soda dissolved in one pint lukewarm water, also applied mustard plaster to back and kept ice bags to head. Also gave Sweet Spirit Nitre 1 tablespoonful and 8 drops Fleming's tincture Aconite in one pint cold water every five hours as used for inflammation of the brain.

Calves were stabled and given bed of musty straw. Our cows have been noticed eating lilac leaves before but never saw any bad results from the same. After death abdomen showed considerable gas. Is the lilac a narcotic and was the death of the calves due to eating the lilac or not? Can you state likely cause of death, and if so, did we use right remedies, if not, what should we have given them instead.

These calves were only three or four days on the lawn and were given besides oatmeal drink twice a day. Previous to this they were fed in stable with dry hay and oatmeal drink.

Ansf—The disease was Inflammation of the brain, and its membranes, when of the brain only, it is called Encephatitis; and when of the membranes only, it is known as Cerebral Meningitis. The double condition is generally present and is sometimes known as common staggers, frenzy, etc., terms applied to different stages of the disease.

Causes are blows to the head, tumors on the brain, food containing deleterious matter, such as ergot or fungi containing narcotic principles is a common cause; hence the name stomach staggers and grass staggers. Highly nitrogenous food, parasites, mineral and narcotic poisons, hot weather, some forms of indigestion, certain plants in some localities cause this disease. In your case it may have been the lilac bark and leaves, although I never saw a case caused in that way. Would suspect something wrong with the grasses, or perhaps the sudden change of food, the stomach not being accustomed to it and the calves may have consumed too great a quantity.

Changes from dry to succulent food should be made cautiously, particularly if the animal has been on dry food for considerable time. The symptoms as described are strongly characteristic of brain disease, although symptoms vary in different stages of the disease. Treatment is frequently unsuccessful. A veterinarian should be consulted if convenient. Bleeding is frequently beneficial weather, some forms of indigestion, to be governed by condition of the pulse. Doses of raw linseed oil for young animals from 12 to 16 ounces for calves of the age of yours and of medium size. If animals are large, larger doses up to 20 ounces may be given and injection of warm soapy water or warm water and glycerine two ounces to a quart of water per rectum, repeated evety three or four hours until the bowels move freely. Small quantities of water frequently and small bran mashes every eight hours, should be given if the animal takes it, but not forced into the stomach. Cold to the head is advisable in most cases and in some cases on the second day doses of Iodide of Potassium twice daily 20 to 30 grains in four ounces of water night and morning is beneficial and after several days (5 or 6) if some improvement takes place doses of Nux Vomica, 20 grains, twice daily and a blister along the back from the loins to the head is good. As a blister mustard, one ounce, pulverized cantharadis, half an ounce, oil of turpentine, one ounce and raw linseed oil four ounces, well rubbed in is useful. The blister should not be applied in early stage but on second day. The animal should be kept as

A Prize Contest open to the farmers of Canada

$3,600 in Cash Prizes for Farmers

READ the conditions of the Prize Contest we are conducting for the farmers of Canada. $400.00 in prizes will be awarded to each Province. These prizes will be divided into four groups, consisting of:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work (shown by photograph sent in) was done.

Every farmer in Canada is eligible. Therefore, do not be deterred from entering by any feeling that you would have little chance against your neighbor. For remember, Prizes "C" and "D" have no bearing whatever upon the quantity of cement used.

As a matter of fact, your success in this contest will depend to a great extent on your careful reading of our 160-page book, "What the Farmer Can Do With Concrete." In this book—sent free on request to any farmer, full instructions are given as to the uses of concrete, and plans for every kind of farm buildings and farm utility. You'll see the need of this book, whether you are going to try for a prize or not. If you have not got your copy yet, write for it to-night. Simply cut off the attached coupon—or a postcard will do—sign your name and address thereto and mail it to-night.

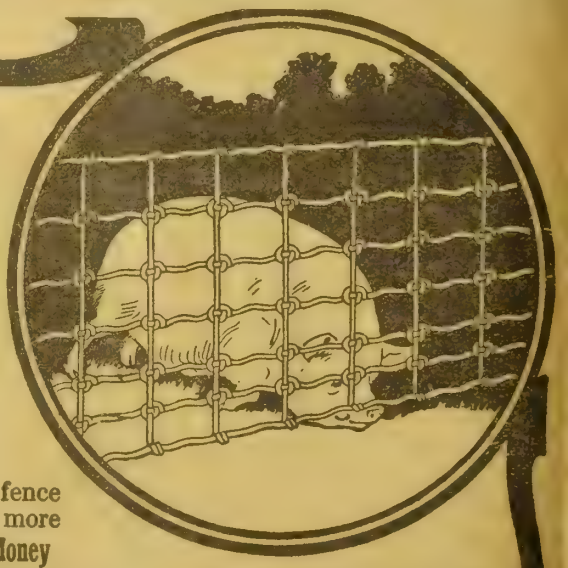
Makes Pigs "Stay Put"



The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 12

New Brunswick Wire Fence Co., Ltd. Moncton, N. B.

quiet as possible in darkened quarters and fed easily digested food, wheat bran mashes and grass in small quantities. Older animals should have same treatment only as a physic Epsom salts in from one and a half to three pound doses should be used instead of oil and proportionally larger doses of the other drugs.—J. Standish, V. S.

Breeding Sows.

Sows may easily be bred within a week after weaning, as they nearly always came into season a very few days after the weaning operation is completed, or sometimes even before the little ones are entirely weaned off. Some sows come into heat while still suckling their young. This is usually injurious to the young, but the sow may be bred at that time. Sows usually come in heat two or three days after parturition, and sometimes hold when bred at that time. My experience, however, is that they are very uncertain, or almost sure not to hold, when bred the second or third day after farrowing.

A sow need not be poor or low in flesh in order to breed or to be a very sure breeder. It is safe to say, however, that sows in rather thin flesh are more likely to hold than sows in very high flesh.

Grounding Fences.

In Bulletin No. 4 of the Manitoba Agricultural College, written by Prof. L. J. Smith, on the subject of lightning and the protection of farm buildings, the following paragraph relating to the grounding of fences is appended:

"Wire fences should be grounded every sixth post to protect live stock in the field from lightning where it strikes and runs along the fence wire. The method is simple and inexpensive. All that is needed is to force a ½ inch round pointed rod down along the post to make a hole and then put down a piece of heavy galvanized wire, going down about thirty inches. The wire should be long enough to reach the top of the post, and should be fastened to the horizontal fence wires with staples."

BETTER THAN SPANKING

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Scarcity of Feed.

The intense heat without rain has made feed scarce, and it will be necessary to use every pound of coarse fodder available. Straw, cornstalks, and even coarse hay are not easily assimilated, which means considerable waste of feed and impaired thrift of the animal. The addition of a small quantity of Herbageum will enable the animal to thoroughly assimilate even the coarse foods, and whey becomes a valuable feed for calves and pigs when seasoned with Herbageum. Whey contains considerable nourishment, but of itself is not easily digested.

It will pay you to start your letter with the words: "I saw your advertisement in The Maritime Farmer."

FLORICULTURE

Anxious Inquirer, St. John:—I am waiting to ask assistance with my garden. The old fashioned Peonies are not flowering, my neighbors are and my plants are much larger than hers. They have bloomed each spring for twenty years, but last spring not so well, and this spring not at all.

There does not seem to be any insects or anything to bother them. They simply do not bud. What can I do to make them bloom. I planted out a number of asters that I bought in the city. The leaves are beginning to shrivel up, also the bottom of the plants; the tops are growing however. Do you think they will come along alright?

My Sweet Alyssium plants were in fine bloom when I planted them, but they are now turning brown and look badly. What can I do for them?

Your Peonies are so thoroughly root bound that they will not flower again until the roots are divided and given fresh soil. In the fall after the leaves are frosted, separate the clumps of roots into quarters with a sharp knife or axe and plant each quarter in rich soil in different spots. The second year they should all be as good as ever.

Your Asters will be alright. They were a little tall when transplanted probably.

Your Sweet Alyssium will also come later. It is only the first flower seedling that gives it that brown appearance. As soon as the new growth forms they will flower again prettier than ever.

Rothesay, writes:—My Rose bushes are infested with green lice, which are clustered about the tips and buds; they are very plentiful. Please tell me how to get rid of them.

Soak a fig of tobacco in boiling water, one quart, for a few hours. Dilute this to one-half strength and sprinkle the bushes. Two applications will usually suffice. Strong Castile soap suds is also good.

H. A., St. John, writes:— Will you please tell me how to treat a Holly Fern about three years old. Lately the leaves have started to fade and dry up and no new ones have come since July. The pot seems amply large and the drainage good and it is free from insects. The plant stands in a large bay window with southern exposure and is treated exactly like a fern of the same kind that is nine or ten years old. Cannot understand this continued loss of fronds

Turn ball of roots out of the pot and look carefully for worms or other insects. Remove dead roots and repot in fresh soil in as small a pot as you can easily get the roots in. It is possible that the plant has been fruiting freely and is somewhat dormant. Now be rather sparing of water on the soil until the new growth appears. Moisture on th foliage is advisable as often as possible.

The Values of Green Manure.

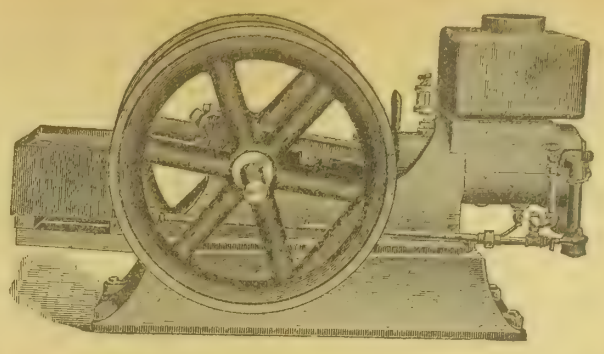
The plowing under of a luxuriant green crop of alfalfa, clover, field peas, or vetches, which might be harvested and sold, or used as feed, seems "against nature." Perhaps it is for this reason that it is comparatively little practiced. Nevertheless a greater gain may often come from plowing under than from harvesting.

Dr. Cyril G. Hopkins of the Illinois station, in comparing green manures with farm manures, makes the following significiant statement: "As an average, animals digest and thus destroy two-thirds of the dry matter in the food they eat, so that one ton of clover hay plowed under will add as much humus to the soil as the manure made from three tons of clover hauled off and fed, even if all the manure is returned to the land without loss by fermentation."

Prof. Marshall of the Colorado Agricultural college says of the addition of green manure to the soil, that it,

1. Increases its fertility by the large amount of organic matter which it acquires.
2. Increases its water-holding capacity.
3. Utilizes soluble plant food that would otherwise escape from the soil.
4. Brings plant food from the lower soil to the surface soil.

So far from being "against nature," this method is but following the lead of and improving upon the method adopted by nature in preparing the land for the occupancy of man. To form humus it has allowed countless forms of vegetation to grow and decay unused; and in the process half or more of the humus-forming and fertilizing elements have been lost, which are saved by plowing under at the time when those elements are most abundant in the plants.—C. R. Barns, University Farm of Minnesota.



The Waterloo Boy Gasoline Engine

s like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new postitive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogue is free. Write to-day.

The Waterloo Gasoline Engine Co.
J. D. FRIER, Sussex, N. B., Eastern Representative.

REGAL LAWN FENCING

Direct from Factory to Consumer.

To Destroy Ants.

The common little red ant, which makes tiny hills on our walks and in the grass, can be destroyed by pouring a little gasoline in each hole. Do not be afraid to use plenty of gasoline, in order to reach the queen or queens which lay the eggs. This liquid, however, will kill grass or plants where it comes in direct contact with them.

The large moulds out of doors, each of which is occupied by hundreds of ants, can be easily treated with bisulphide of carbon. Make eight or ten holes with a cane or croquet stick, about eight inches deep, in each mound. Into each hole pour a good tablespoonful of bisulphide of carbon, closing each hole with earth, and then throw a couple of wet burlap sacks over the hill, leaving them over night. One might have to do this twice possibly; or, in other words, until the queen or queens are killed.

While ants, when seen climbing up apple trees or shrubbery and plants, generally, do not directly injure the plants, since they are for the most part after the lice which give up to appears to leave a deposit which is them in response to their caresses, some honey dew, of which ants are very fond, nevertheless the black ant sometimes girdles and kills shrubs like the lilac and snowball. When ants are found at this work, we first have recourse to strong toacco water to see whether we can drive them away. If they still persist in eating the bark, we advise uncovering the crown and larger roots, mixing up arsenate of lead with a little water, and applying it as thick whitewash to these parts. Arsenate of lead is a poison, which, however, applied un that way, would not injure the bush.

Where ants come from the outside, and are extremely troublesome, they can be deterred from entering the house by applying with a brush a band of sticky tanglefoot, which can be purchased in cans, on the outside of the foundation of the house. As long as this is kept sticky no ant can get across it.

A mixture of molasses with abundance of Paris green is effective in destroying some ants in the house. A saturated solution of alum, applied to shelves and allowed to dry, obnoxious to ants, and they avoid it. One must bear in mind, however, that until the queen or queens are killed, ants will continue to come.

Familiar resorts are the scattering of powdered borax; the putting of the legs of the refrigerator or of the tables holding food, in pans filled with water covered with kerosene; and the filling of sponges with sweetened water, which attracts the ants, and when filled with ants, dropping them into boiling water. In the case of the very minute ant which sometimes infests homes where all other remedies have failed, the fumigation of the house, in the absence of the family, with the deadly gas known as hydrocyanic gas—followed by three or four days exposure to a winter temperature of four degrees below zero, secured by opening all the windows—has been found effective. So says Prof. Washburn in Minnesota Insect Life.

Value of Feed for Milk.

As compared to whole ear corn, corn and cob meal is a little better. The difference is very slight, however, and is probably due to the difference in digestibility, made possible by grinding.

Gluten meal is just about equal to cottonseed meal. More of it, however, must be fed. In a ration the quantity should be about as follows: Gluten meal three pounds, corn meal two pounds, bran two pounds. When cottonseed meal is used under the same conditions, the ration should be made up as follows: Cottonseed meal two pounds, corn meal 2½ pounds, bran three pounds.

About one-fifth more milk will be obtained from the use of cottonseed meal when that feed is substituted for bran. It does not indicate, however, that it is especially advisable to substitute cottonseed meal for bran. The two go together well in rations.

In comparing linseed meal with cottonseed meal it is difficult to note any particular difference. Sometimes cottonseed meal will produce a little more milk, but under the same conditions linseed meal will give better returns if the product is made into butter.

Dry distillers' grains have a high value for milk production. As compared to oats they will produce about 19 per cent more milk when fed under like conditions.

HUNDREDS OF OPPORTUNITIES TO SAVE MONEY

THREE STRIKING FEATURES OF OUR MIDSUMMER SALE

UNUSUAL VALUES

OUR July and August Sale has always been a grand opportunity for you to save money, but no previous Sale ever held by T. EATON Co. Limited has equalled this one. We never listed values before which were quite as good as those contained in the 24 pages of our Midsummer Sale Catalogue. We are not over-estimating them: in fact, we cannot do them justice by describing them.

YOU MUST SEE THE GOODS and examine them to appreciate the phenomenal opportunities to save money, which we are placing before you. If you have not received a copy of our Catalogue, write for one immediately. We are not exaggerating the merits of this Sale. It would be folly for us to do so, since our Guarantee allows you to return any article with which you are dissatisfied and get your money back in full.

SUPERIOR QUALITY

ALTHOUGH the prices quoted in our Sale Catalogue are wonderfully low, nevertheless the quality of the goods has in no way been sacrificed to make the price. We have bough in enormous quantities, we are selling in enormous quantities, and to create two months of hustling business, we have reduced our already low margin of profit. Every item is something which every household is either needing at present or soon will be. Buy now either for present or future needs. It will pay you to do so.

The PUBLISHER'S DESK.

A New Grand Trunk Publication.

A new publication has just been issued by the Grand Trunk Pacific Railway in connection with a territory which is practically unknown. This publication deals with the Plateau and Valley lands in Central British Columbia, and which will be reached by the main line of the Grand Trunk Pacific Railway west of Fort George and east to Hazelton, British Columbia.

The descriptive matter was secured with much difficulty by an exploration party sent out last year who discovered the possibilities of the marvellously rich and climate favored land referred to, and the statements made are based directly on these researches Facts have also been secured and incorporated in this publication from Government Agents' reports, and equally reliable sources, and every care has been taken in the compilation of the text which will be found correct in all statements.

The publication deals with the markets, mineral production, temperature, altitude, timber lands, climate, settlement, soil and class of lands, homesteads, etc., and also gives full particulars as to how to secure Government lands, taxation, education, social conditions and advice to immigrants.

A new and very interesting map accompanies the book which is profusely illustrated and most interesting in every particular. The illustrations are made from direct photographs taken by the specially equipped party sent out by the Grand Trunk System last year.

The Grand Trunk Railway has just issued the first edition of a reconstructed compilation of their complete time table in folder form. After careful thought and much labor this work has been turned out so that the travelling public may, with as little trouble as possible, readily turn to any information they desire concerning this extensive system.

The time tables not only include all the lines of the Grand Trunk Railway System, but a complete timetable of the lines of the Grand Trunk Pacific Railway.

The index is so arranged that the name of any station can be readily turned to as the timetables have all been numbered, and the number of the station in which the timetable appears is given in the index opposite such station.

Information for travellers regarding sleeping cars, stop overs, exchange of tickets, free side trips, etc, is given, and complete information as to baggage arrangements.

A series of condensed timetables are included in the folder over which is inserted an outline map of the route between the points given in these timetables.

A new map has also been included, which shows the Dominion of Canada and a portion of the United States from the Atlantic to the Pacific, and on which is shown the line of the Grand Trunk Railway system, the Grand Trunk Pacific Railway and their connections.

A page is devoted to sleeping car and parlor car tariffs and another to the Cab tariffs of the cities of Montreal, Ottawa, Toronto, Hamilton, London and Chicago.

As much information as possible has been embodied in this publication, and the information has been so arranged as to make the contents as plain as possibly can be done with a railroad folder.

First Class School for Girls and Young Women

The Catalogue of Acadia Seminary, whose advertisement appears elsewhere in our columns, has come to our table. An examination of the booklet, which is well printed and illustrated, shows that the work of this well known school is organized in three departments, The Academic Department includes the Collegiate Course, the Sopomore and Freshmen Matriculation courses. The Fine Arts Department included courses in Music—Pianoforte, Voice, Violin, and the usual theoretical branches—Art, in Oils, Water Color and China Painting, and the new work in Arts and Crafts and Oratory. The Department of practical Arts provides courses in Household Science, Business, Stenography and Typewriting. All of these courses are characterized by moderness, breadth and thoroughness, and aim not merely to prepare the pupil for the professions open to women but for COMPLETE LIVING.

To do this Work a staff of twenty teachers of fine personality, qualified by training temperament and experience, is employed. Admirable provision is made for the development of the physical life of the girls by the presence on the staff of a resident Trained Nurse and a competent Physical Director. Simplicity in living and dress, high ideals in conduct and thoroughness of work are insisted upon. That the school is a popular one is evidenced by the fact that during the last seven years the registered attendance has been doubled.

Full particulars concerning the work of Acadia Seminary may be had by writing PRINCIPAL, H. T. DeWOLFE, Wolfville, Nova Scotia.

TENDERS FOR DREDGING.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Dredging Oromocto Shoals, N B.," will be received until 4.00 P. M., on Monday, August 21st, 1911, for dredging required at Oromocto Shoals, River St. John, N. B.

Tenders will not be considered unless made on the forms supplied, and signed with the actual signatures of tenderers.

Combined specification and form of tender can be obtained on application to the Secretary, Department of Public Works, Ottawa. Tenders must include the towing of the plant to and from the work. Only dredges can be employed which are registered in Canada at the time of the filing of tenders. Contractors must be ready to begin work within thirty days after the date they have been notified of the acceptance of their tender.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent, (10 p. c.) of the amount of tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the contract If the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 2, 1911.

Newpapers will not be paid for this advertisement if they insert it without authority from the Department.

Daily Air-Ship Flights at Halifax Exhibition.

The Annual Nova Scotia Fair, which opens August 30th, will be a Happy Blending of Amusement and Educational Features.

The dates of the great Exhibition in Halifax are rapidly approaching. On the thirtieth of this month the Industrial Fair, of which this province is so justly proud, will, open its gates at Halifax, For the past couple of years the Commission having the Exhibition in charge have devoted themselves exclusively to what might be called the legitmate features or the educational aspect of the Fair. This side of the Exhibition will not be neglected in the coming exhibition. The educational exhibion in manufactures and our natural resources will be magnified and made the most of, but the Commission will seek to make the amusements connected with the Fair a source of real attraction. Education and Amusement will be combined in a happy way without the sacrifice in any respect of the one for the other.

A salient feature of the amusement program will be the Air-ship flights by Frank B. Goodale, an aeriel aviator twenty-three years old. The newspapers of the United States have devoted a great deal of space to the splendid work of Mr. Goodale, who will make daily flights from the Exhibition Grounds at Halifax, and who will be seen as an aviator whenever the wind is not blowing more than twenty-miles an hour Besides Mr. Goodale the Commission have secured Seven Good Vaudeville acts.

There will be Horse Racing on every one of the seven days the Exhibition continues.

Destroying the Sparrow.

The English sparrow is very destructive to farm crops and machinery, they also discolor beautiful buildings in cities and towns Destroy their nests. Feed them with poisoned wheat. Prof. Shutt recommends the following: 5 grams 7.7 grains of strychnine or strychnine sulphate to one pound of wheat. If strychnine is used, it will be found necessary to add a few drops of sulphric acetic acid to bring the alkaloid into solution. If the sulphate of strychnine is employed, no such addition to the water is necessary. The solution of the poison should be of sufficient volume to thoroughly moisten the total quantity of wheat. The grain is allowed to soak over night, then dried by being spread in a thin layer to the air and put in a suitable place for the sparrows.

Another Good Whitewash Mixture

The following receipe for making whitewash gives good satisfaction:

Take half a bushel of unslacked lime, slack it with boiling water, cover it during the process to keep in steam, strain the liquid through a fine sieve or strainer and add to it a peck of salt, previously dissolved in warm water, three pints of ground rice boiled to a thin paste, and stir in while hot. Add five gallons of hot water to the mixture, stir well and let it stand a few days covered as near air tight as possible. It can be colored by adding ochre, lampblack, ground red chalk or bluing to suit.

Sunstroke.

Mr. William Mole, Hon. Veterinary Surgeon to the Toronto Humane Society, gives some good advice on the care of horses during the hot weather.

"When the barometer is low, the weather hot, and humid, horses suffer from heat," said Mr. Mole. "The animal is languid, perspiration is profuse, the evaporation is confined, and sun strokes or heat strokes are common. The brain symptoms are often alternate with fainting, and death results in a few minutes.

The first symptoms are: Profuse perspiration. Then the horse begins to pant and the sweat dries up. He begins to stagger, becomes insensible, and goes down, unable to rise.

TREATMENT.

Get the animal into the shade as quickly as possible. Sometimes this cannot be done, but the object is to reduce the animal's temperature by preventing the hot sun's rays pouring on the animal's body. To aid in doing this put sacks of ice on the head and neck, and spray the body with cold water, not directly out of the nozzle of the hose, but by pinching the end of the hose, pointing upwards, so as to let the water down like rain on the animal's body. A watering can is preferable to the hose pipe.

Give a drink of water ever five minutes. At first the animal is unable to drink, owing to insensibility, but wash the mouth a few times until he recovers, and he will drink greedily. Half a pint of whiskey in a quart of water may be administered with good effect.

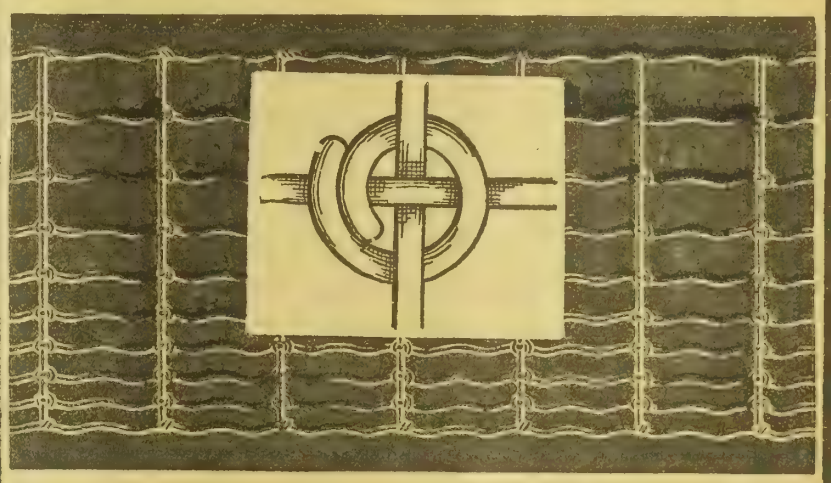
Prevention is better than cure when on the road, so water frequently, especially when the animal is perspiring profusely. When the horse arrives home from work sponge him over with cold water and let him dry. Do not use the hose; do not put him into the stable nor feed him until well cooled off. During this time give all the water he will drink in small quantities every 10 minutes.

If treated in this way the horse will be ready for work next day, but if he starts tired he will probably collapse before night. When a horse lapse is imminent, consequently he should be at once stopped, driven into the shade, given water, and in a few hours the distress will pass away and you may be able to drive him home in safety."

Royal Brand Farm Fencing

DIRECT FROM FACTORY TO FARMER

FREIGHT PREPAID TO YOUR NEAREST R. R. STATION



ROYAL FENCE is made of the best all No. 9 hard steel wire, heavily galvanized and perfectly woven. The farmers of Ontario have purchased over 200 carloads of Royal Fence this season. Your money back and we pay freight both ways if not satisfied.

The following styles we carry in stock and can make prompt shipment of any amount. All fence put up in 20, 30 and 40 rod rolls only.

6-40-0 Has 6 line wires, 40 in. high, 9 stays to the rod. All No. 9 hard steel wire. Spacing 7, 7, 8, 9, 9. Price per rod, freight prepaid 21½c

7-40-0 Has 7 line wires, 40 in. high, 9 stays to the rod; all No. 9 hard steel wire. Spacing 5, 6, 6, 7, 7½, 8½. Price per rod, freight prepaid 24c

8-40 Has 8 line wires, 40 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 6, 7, 7, 8. price per rod, freight prepaid 29c

7-48-0 Has 7 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. 5, 6, 7, 9, 10, 11. Price per rod, freight prepaid . 25c

8-48 Has 8 line wires, 48 in. high, 12 stays to the rod, all No. 9 hard steel wire. Spacing 4, 5, 6, 7, 8, 9, 9. Price per rod, freight prepaid 30c

9-48-0 Has 9 line wires, 48 in. high, 9 stays to the rod, all No. 9 hard steel wire. Spacing 3, 4, 5, 5, 6, 8, 8, 9. Price per rod, freight prepaid 30c

Pratts

Poultry Regulator

They will be back at work again laying more eggs than ever. Pratts Poultry Regulator is a Conditioner, Regulator, Egg Producer and prevents disease by keeping the digestive organs working properly, regulating the bowels and purifying the blood.

Satisfaction Guaranteed or Money Back

Our dealers refund your money without question if any Pratt Preparation fails to please you.

25 lb. pails $2.50. Also in smaller packages and 100 lb. bags. If your dealer cannot supply you, write us.

Pratts Cholera Remedy is guaranteed to prevent and cure this disease. Pratts Lice Killer will positively destroy lice.

We will mail you free copy of our 1911 Poultry Book on request.

PRATT FOOD COMPANY OF CANADA, Ltd.,

Dept. 68. Toronto, Can.

Producing Comb Honey

To produce a large per cent of gilt edge comb honey requires experience and lots of attention, a strong colony of bees and a good flow of honey. The first two items depend on the apiarist. I examine all colonies early in the season to ascertain if they have a good, prolific queen and plenty of honey to foster brood rearing. Bees will increase their brood as fast as they can care for it. The apiarist who gets anxious to assist the bees in the process and spreads the brood often finds it a mistake in this climate; at least, so I think. I recommend using full sheets of thin foundation in all sections, thereby increasing the yields greatly, besides getting straighter and smoother combs. It is a good plan to leave ¼ inch space at the bottom of the foundation to give room for sagging and to prevent buckling.

Some apiarists recommend extra thin superfoundation, but it is liable to sag in hot weather and is sometimes torn down by the bees during a scarcity of honey. I prefer the thin only, and have received no complaint in regard to what is usually called fishbone in comb honey. In using starters only the bees frequently build drone comb below, giving the honey a very rough and uneven appearance. Bottom starters are used by some, but I have never felt the need of them and never used them. They require more labor. I have endeavored to get the maximum quantity of fine quality with the least amount of labor at the commencement of the honey flow.

I place the supers on all colonies that are in suitable condition, but not until they are in good condition. If the colonies are populous, with honey flow and weather condition right, I place an empty super under the first when the bees begin sealing. I don't carry this plan too far. Here is where an apiarist needs plenty of experience.

I never allow more than three supers on a hive at one time. If the bees need more room I take one super off when I need one. Only on the strongest colonies do I ever allow even three supers. I think by not putting on too many the bees fill and finish them better. I examine the supers on all such colonies every other day. This means a lot of work, but it keeps me posted on the bees' needs and pays well. It is one of the points in getting gilt-edge honey to have the sections filled quickly. The supers must be removed about as fast as sealed to be fancy, especially on the old colonies, which stain the sections very quickly in hot weather. I remove the surplus as soon as the combs are sealed to preserve the whiteness of the cappings, and store in a warm and dry room until ready for market.— E. Elethort, N. Y.

Hoof Inflammation.

D. D. S., P. E. I.,—Please describe cause and cure of the following:

Hourse four years old, while standing advances front foot to relieve all weight and sometimes will rest on the toe, hoof seems smaller. Would driving be hurtful or is he better on the grass or in the stable, and which is the best way to have him shod?

Ans.—The symptoms described is evidence of inflammation in the hoof and strongly indicate navicular disease (coffin joint disease), sometimes a corn may cause such action. Cause: Hereditary influence, short upright pasterns, spavin, concussion or hard roads, fast driving, stepping on small stones, particularly a round one that rolls under the foot, sometimes from the foot balling with snow and corns may be caused by bad shoeing, having shoes on too long, or some solid substance as a stone, or impacted hard clay or gravel between the shoe and sole of the foot. Treatment not always satisfactory. Remove the shoe, level the foot, poultice the foot for five days with warm, soft, moist substance, as boiled turnips, flax seed or bran. Change poultice twice a day, clean foot well at each changing of poultice. Then clip hair off from around the foot for three inches above the hoof, wash clean, rub dry and apply a blister. A good one is one dram of Mercury Biniodide, 2 drams pulverized Cantharadus and 1 ounce of vaseline or lard, well mixed and rubbed in well where the hair is clipped off. Twenty-four hours after applying grease, and after another twenty-four hours wash off and then grease again. Tie the head to keep the nose from the blister for first 48 hours. After the scale heals up, turn the animal to grass on medium soft, moist pasture. Keep the foot properly levelled after recovery. Road work is more injurious than farm work. Sometimes the treatment requires repeating.—J. Standish, V. S.

Ruptured Blood Vessel

R. E. B., Annapolis Co., N. S.:—Please answer through the columns of the Maritime Farmer the cause and cure of the following:

I have a heifer, 3-years-old, that freshened last September, apparently in good health. Two weeks ago she commenced giving bloody milk from her right fore-quarter. Part of the milk looked like blood for four or five days, then it became thick with clotted blood and there was a small lump come on the teat, about two inches from the end. I could not see a lump or scratch anywhere. There is no blood in the milk now but she only gives one-half the quantity of milk from this teat. She gives as much as ever from the other three.

Ans.—The cause is rupture of a blood vessel in the udder. The rupture may be caused by external violence as a kick from another animal, a blow from a stick or stone, or by crossing a fence or log, more likely when the udder is distended. Occasionally such trouble is caused by another animal stepping on the udder, when the cow is lying, or a calf may cause it by a strong butt when the udder is distended. For treatment reduce feed. Sometimes it is advisable to give a physic—Epsom salts, from one to two pounds, quantity to be governed by age, size and temperament of the animal, add from one-half to one ounce of ginger, mix in one quart warm water and give at one dose as a drench. After the physic has operated give from two to three drams of saltpetre a day for a week, and milk frequently, three or four times a day. Bathe udder well with warm water twice a day, rub dry and apply camphorated oil; or an oil made by mixing half an ounce of Spirits of Camphor, half an ounce of fluid extract of Belladona and eight ounces of raw linseed oil.

Lumps on the inside of the teat are difficult to treat successfully; sometimes they can be removed. It is advisable to have a veterinary surgeon perform the operation, but at times they fail. If not an extra valuable animal for milk fatten for the butcher.—J. Standish, V. S.

The "Ohio" Gasoline Engine

has been longer on the market than any other gasoline engine sold in the Maritime Provinces. It has all the good features of other engines, besides a number of its own. Its vertical valves mean more power and less fuel consumption. The fine finish shows that it has good workmanship throughout. Ohio Engines have been running nine years and are doing as well to-day as when put in. Don't buy an inferior engine when you can get a good one at practically same price. The Ohio Hopper Cooled Engine is complete in itself, requiring no outside gasoline tank or water barrel, making it the best and most complete self-contained engine on the market.

Cutting Grain for Seed.

Grain growing is one of the principal phases of Canada's agriculture, and, to make the best of this, it is necessary that a very high quality of seed is produced. Many grain growers make it a special line of their business to produce seed of a high standard, and are, so to speak, "breeding seed grain." Harvest is now at hand, and in many districts much of the winter wheat will have been reaped before this is read, while in other districts harvest will not have begun.

One of the important points to be considered in producing the strongest and best of seed is the degree of maturity at which the grain is cut. Plants use up all their energy in the endeavor to produce seed and to insure the propagation of their species. As the grain begins to ripen, the sap containing the soluble plant food is taken up to the seed, and the seed is thus matured in the best possible manner. There are several stages in the maturity of grain, from the early milk stage to the dead-ripe stage, when the grain has absorbed all the possible nutrient material from the straw, and the straw is about to break or crinkle down.

Many grain growers cut their grain a little on the green side, claiming that a brighter sample is obtained, and that the sap retained in the

Agricultural College
TRURO, NOVA SCOTIA.

Next Session of Full Course begins NOVEMBER 1st, 1911.

Next Short Course for Farmers and Farmers' Sons begins JANUARY 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 2nd, 1912.

Three hundred and fifty (350) students enrolled in the various classes during the past session. A large increase is expected next Session.

Tuition FREE to all students from the Maritime Provinces.

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

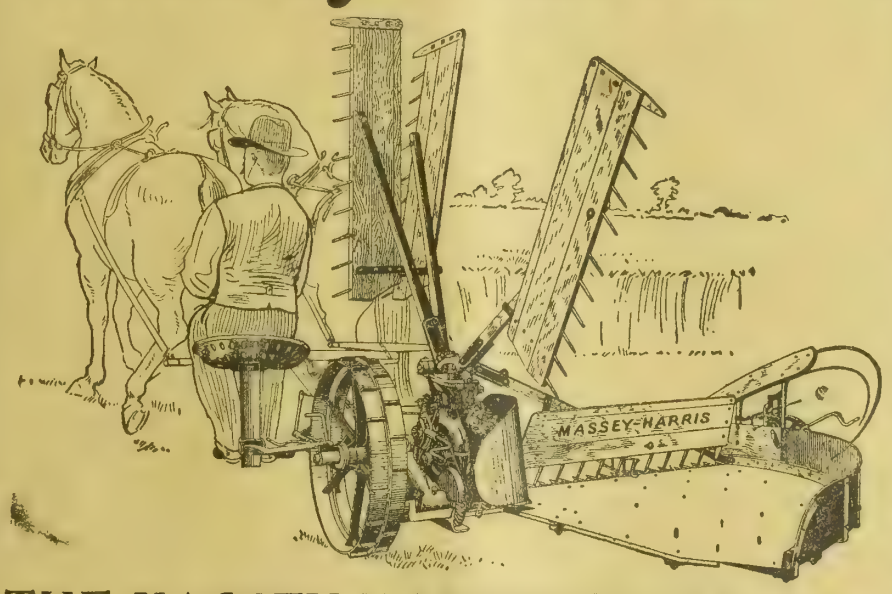
Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmer's sons who have had an opportunity to acquire a school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

straw gives it a higher feeding value, as it is not quite so fibrous and is a little more palatable. This is no doubt true, but where seed grain is the primary object, the crop should not be cut until fully matured. As soon as the growth of the plant ceases, the seed takes all the plant-food material from the stalk and stores it within itself, and it is important that the plant be not cut until all the constituents are so stored that can possibly be stored in this way. The seed, besides carrying the young embryo plant, must contain enough food material to keep the young plant alive after germination and before its roots have food from the soil. A great deal depends on the size and plumpness of the seed, because a large, plump seed is a stronger seed, and will produce a healthier, more growthy plant than a small, shrunken seed. In germination, suitable temperature, accompanied by moisture, causes the starch of the seed to be changed to sugar, and the plant food held in the seed is changed to an available form for the maintenance and growth of the young germ. It must always be remembered that the young, sprouting plant must depend for a certain time on the food material within the seed itself. For this reason, grain that is being grown for the production of high-class seed should not be cut too green, but should be left to mature to the ripe or dead ripe stage and only be harvested in time to prevent serious loss from shelling or from breaking down so that heads are cut off and lost.—Farmers' Advocate.

Massey=Harris Reaper.



The only Reaper with a steel platform. The large drive wheel gives ample traction. Gears are well protected by shields. Will cut clean without digging into the ground. Pitman has steel strap at knife end and brass bushing at crank end. Driver has perfect control of the Rakes. Platform is easily raised and lowered. Main wheel runs on Roller Bearings. Table is easily tilted by convenient lever. Machine can be folded for transport easily and quickly.

Harvesting Alfalfa Without Hand Work.

Continued from page 755.

then hauled into the barn. As we use a hay loader, the only hand work is on the lead and a little in the mow.

It is a general opinion that as much tedding as I give my alfalfa is not advisable in that the leaves will be knocked off. I do not find that not exposed to the direct rays of the sun for any length of time, and the alfalfa cures more quickly and more naturally. I used to avoid tedding whenever possible, until one day it struck me that I was not giving the leaf an opportunity to perform its natural function. I changed my methods entirely, but my new method was so out of the ordinary that it was several years before I advocated it in public.—Hy. Glendenning, Ontario, in Farm and Dairy.

the leaves are knocked off. Tedding merely gives the leaf an opportunity to perform its normal function. The function of the leaf in curing hay of any kind is to carry off the water. If the alfalfa is left in the windrow, as is so commonly advocated, the leaves are exposed to the rays of the sun for a long time and are killed. The water then has to come out of the stalks by some unnatural method, and a poor hay results.

By constant tedding the leaves are

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange, The address must be counted as part of the advertisement and each initial or a number counts as one word, Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office, Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue, No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion, MARITIME FARMER, Sussex, N. B.

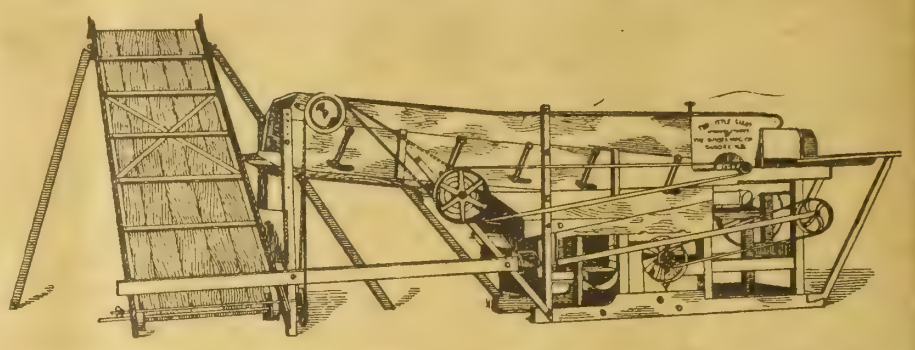
The Best Judge of a Thresher
Is the Man Who Has Used it.

It's not the purpose of this advertisement to tell in detail the merits of the Sussex Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Should any reader wish a detailed description we will mail descriptive catalogue on application.



Four Horse Thresher may be operated with 5 to 7 H. P. Gasoline Engine.

THE SUSSEX MANUFACTURING CO., Sussex, N. B.

DEAR SIRS:—It affords me much pleasure to write that the Threshing Outfit purchased from you has given entire satisfaction. The nearest estimate I can give as to the number of busnels threshed is 60 bush. of oats in one hour. I find that the Sussex Little Giant Threshing Machine is far ahead ofany other threshing machine I have ever used. I remain, Respectfully yours, E. F. CRABB, Greenwich Hill.

We manufacture the celebrated Little Giant Threshing Machines—the best on the market—in one, two and four horse sizes. Centrally located, as we are in Sussex, we are wthin easy reach of all parts of the Maritime Provinces and can cater to your wants better than any other Canadian or American firm. Send for cuts, descriptions, prices and full particulars to-day. All inquiries receive our careful and prompt attention.

THE SUSSEX MANUFACTURING CO., Ltd., Sussex, N. B.

MARKETS.

St. John Prices.

GRAIN—Oats 50c. to 55c. per bushel.

FEEDSTUFFS—Bran, $24 per ton; corn meal, $1.55.

Milch Cows, $45.00 to $55.00; sheep $3.50 to $4; lambs $4.00.

DRESSED MEATS—Beef (carcass) 7c, to 9½c.; beef (retail) 10c, to 20c ; mutton, 8c, to 9c.; veal, 9c. to 11c,; lamb, 12c. to 13c. carcass; pork, 9½c. to 10c,

HORSES—Drafters, $200 00 to $250.00; roadsters, $175 to $225; carriage $175 to $225.

DAIRY PRODUCTS—Creamery butter, 22c, to 24c.; dairy butter, 20c, to 22c ; cheese 12c, to 13c.

POULTRY AND POULTRY PRODUCTS—Eggs, fresh, 25c.; chickens, $1.00 to $1.25; ducks, $1.50 to $1.75 pair; turkey, 18c. to 25c ; geese, $1.25.

FRUIT—Raspberries, 10c. to 12c. box.

VEGETABLES—Carrots, new, 40c. 1 dozen bunches; potatoes, new, $1.00 bush.; turnips, 60c to 80c. bushel.

MISCELLANEOUS—Hay, $8.00 to $12.00 ton; wool, 14c. to 21c.; beef hides, 11c.; calf skins, 17c.

Charlottetown Prices

GRAIN—Oats, white, 38c to 40c; black, 40 to 48c,

FEEDSTUFFS—Retail, bran, $1.25 to $1.35 per bag; shorts, $1.45 to $1.50; middlings, $1.45 to $1.50, oil-cake, $2.25 to 2 50; corn meal, $1.80,

LIVE STOCK—Butcher's cattle, 3¼ to 5c; stockers, 18c to 30c, milch cows, $35. to $60., sheep, 3¾c to 5c; lamb, $2.50 to $4.50 each.

DRESSED MEATS—Beef, (carcass) 8c to 10c; beef (retail) 10c to 18c; mutton, 10c to 16c; veal, 4½c to 5½c; lamb, 12c to 10c.

HORSES—Drafters, $175 to $250; roadsters, $175 to $250.

DAIRY PRODUCE—Creamery butter, solid, 23c to 23½c; pats, 23½c to 24½c; dairy butter, 18c to 20c; cheese, 12 3-16c board price, 12½ to 13c wholesale price.

POULTRY & POULTRY PRODUCE—Eggs, 17c full count; fowl, 12c to 14c; chickens, 70c to $1.00 pair.

FRUIT—Cherries, 12c to 14c; raspberries, 10c to 12c, currants, black, 12c to 14c;

VEGETABLES—Carrots, 5c per bunch; potatoes, old, 50c, new, $1.00; turnips, 40c to 60c bushel; beets, 5c per bunch,

HAY—$9.00 to $10.00 per ton; straw, $5.00; wool, 23c; beef hides, 10c; calf skins, 12c to 16c; sheep skins, 20c to 35c; lamb skins, 20c to 30c,

The market is quiet and short. Butter and cheese are higher, the former selling in round lots by factories at 23c for solids, Cheese went to 12 3-16c on the boat yesterday. Pastures are very dry and the make will be short and we think prices are likely to be fully maintained. Beef is lower as the usual run of grass beef, some of only fair quality is now on the market. Old potatoes are about cleared up and what few offer sell at about 50c. New potatoes are very small yet, but are now on the market at about $1.00 per bush. Eggs are advancing rapidly in price and buyers are to-day paying 17c full counts and as shrink is heavy it means anywhere from 17½c to 18c first cost. Small fruits were scarce this year owing, no doubt, to the very dry season and price consequently ruled high. Blueberries are plentiful and sell in a retail way at 6c to 8c per quart. Farmers who have old hay on land are not anxious to sell and present prices will not induce them to move it, consequently there is very little being done in this line.

Halifax Prices.

GRAIN—Oats 50c. to 55c.; peas, $4.75 to $4.90 bbl.; barley, 75c to 80c bush.

FEEDSTUFFS—Bran, $23.00 to $23.50 ton; Shorts, $25.50 to 26.00; middlings, $26.00 to $26.50; oil-cake, $2.10 to $2.15 per 100 lbs.; gluten meal, $28 50 to $29.00 ton; corn meal, $1.60 to $1.65 per bag, 98 lbs.

GRASS SEED—Timothy, 12c to 13c., com. red clover, 15c to 16c.; mam, red clover 15c to 16c.; alsike 15c to 16c.

DRESSED MEATS—Beef (retail) 15c to 20c lb. pork 12c to 15c.

HORSES—Drafters, $175 to $250.; roadsters, $200 to $250.

DAIRY PRODUCTS—Creamery butter, 25c. to 30c.; dairy butter, 22c to 25c.; cheese, 14c to 14½.

POULTRY & POULTRY PRODUCTS—Eggs, 24c to 25c doz.

MISCELLANEOUS—Hay, $10.50 to $11.50 ton; straw, $7.50 to $8.50 ton.

VEGETABLES—Potatoes, 80c to $1.00

FOR SALE.

One Guernsey Bull, 26 months old; three Guernsey Bull Calves, dropped in December, and Females, any age.

J. F. ROACH, 'Phone 111. "Sunny Side Stock Farm." SUSSEX, N. B.

When is the Milk Good.

How soon after calving may a cow's milk be fit for use, if she is in good condition?

Reply: About a week, and generally the tenth or twelfth milking. This is providing, of course, she is in normal condition in every way; but as long as an abnormal condition prevails so as to affect the milk-producing organs, the milk should not be used. Rules laid down by health boards and milk commissions generally set the period at from ten days to two weeks, but this is not necessary in actual practice, when the cow is in normal condition, and is meant as a precautionary measure on the part of those making the rules, so that they will be sure to set a wide enough limit, more than anything else.

Value of Hen Manure.

At the New York experiment station, as a result of an investigation, it is figured that the night droppings of each hen average about 31 lbs. for the year. It is believed that these droppings are still greater during the day when the hen is exercising. A Maine experimental station places the total droppings at 75 lbs. per day. An analysis of the fertilizing value of these droppings indicates that 100 lbs. of fresh hen manure is worth 65c., so that droppings from a flock of fifty hens, if properly cared for, should be worth $24.38 per year.

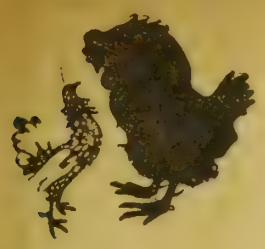
Turn Under Clover.

Last week I had a piece of clover turned over. It was knee high, out in bloom, and very thick, and will bring a fine crop of corn, besides benefitting the land. But, oh! didn't I catch it from the other farmers who are following old methods. I was told that "the hay would have paid twice as much as all the corn you will raise." Yes, but see here; I needed that humus in the soil, and if I don't hit it on corn, but I think I will, I"ll get it back when I sow wheat this fall. There is entirely too much of this cutting off clover to feed to the stock, and robbing the soil.

They say, "cut the first crop, and let the second or seed crop, be turned under in the fall and seed the ground." But this method is too uncertain for me. I'd sooner corn the first crop, put in wheat in the fall, and sow clover seed among the wheat in March. You can get a stand every time then. Besides, I don't feed clover hay. I've seen some of the chronic indigestion heaves, bloat, etc., caused by stock eating even dry clovers of all sorts.

For good hay, give me clean, weedless, well-cured timothy, with a third or fourth clover. Then you've got a ration. But all the whole world needs clover turned under every few years to repair the foolish soil robbing policy of our ignorant granddads.—C. E. Davis, Maryland, in Successful Farming.

When the digestion is all right, the action of the bowels regular, there is a natural craving and relish for food. When this is lacking you may know that you need a dose of Chamberlain's Stomach and Liver Tablets. They strengthen the digestive organs improve the appetite and regulate the bowels. Sold by all dealers.



There's no room for argument because plenty of eggs—big ones—are positively assured if you use

Pratts Poultry Regulator

[For 36 years called Pratts Poultry Food]

It has been demonstrated to thousands of successful poultry-raisers that it makes hens lay all the year round—that it makes chicks grow bigger and quicker and prevents loss from disease. Why not make a test with your flock? Costs less than 1c a month per hen.

Pratts Roup Cure is the only *sure* cure for genuine cases of roup. Don't risk loss with imitations. Results are quick and permanent. 25c a package.

Pratts Lice Killer (*Powdered Form*) quickly kills all lice on all kinds of fowls. Get rid of the lice and you'll make more profit. None so good as Pratts. Costs only 25c and 50c a package.

Pratts Head Lice Ointment for little chicks—sure and quick. Excellent for scaly legs, too.

Holstein Bull for Sale!

We have a pure bred, registered Holstein Bull, 8 months old, for sale. This bull is well grown, thrifty and fit to head any herd. His dam was producing 70 pounds milk per day, two weeks after freshening. She is due to freshen again in September and is still giving from 20 to 25 pounds. His sire produces as uniform a lot of calves as we have ever seen. If you want him write to-day.

W. C. MacLEOD & SONS,
"Gold River Farm,
Loch Lomond West, N. S.

Shorthorns For Sale.

We have sold eight pure-breds and have a choice lot of roan and reds left, ages from 13 to 26 months. Also a large red bull, 3 years old.

C. C. H. EATON,
Canard, N. S.

FOR SALE!

To make room, 100 Breeding Hens and Cocks, Barred and White Rocks and R. C. Reds, also some Cockerels and Pullets to spare in each variety.

EGBERT DeYOUNG,
Box 120. Dartmouth, N. S.

Eggs for Hatching.

Rose and Single Comb R. I. Reds and S. C. Brown Leghorns. Both matings $1.50 per 15 eggs. Columbians and Wyandottes $1.00 per 13 eggs. 120 Egg Incubator and Brooder for sale.

W. H. HENRY,
Shubenacadie, N. S.

"Hillside Stock Farm"

Ayrshires of the choicest strains, imported and Canadian bred, young bulls and females, all ages for sale. We made a personal selection in Scotland last summer and can supply your wants. We invite your inspection when visiting the College Farm. Come and see us.

PRESCOTT BLANCHARD,
Truro, N. S

MAPLE GREEN FARM.

Holsteins of the richest breeding and highest production; nothing for sale at present except a choice Bull Calf, out of a 17.35 lb. Jersey three year old; seven of the nearest females in his pedigree average over 25 lbs. butter in 7 days and he is individually as good as his breeding. For particulars write

THE BOOK DESCRIBES EVERY STEP IN DETAIL

IN the organization and construction of rural telephone lines, this book, "How to Build Rural Telephone Lines," is a practical guide. It is a carefully classified volume, covering everything you need to know, from the inception of the idea to the moment the telephone is hanging on your own wall, ready for you to use. No question on the building of rural telephone lines can possibly arise without your being able to find the answer to it in this volume. It offers explanation on every point—the solution for every problem. If you are even the least bit interested in the subject, all you have to do is to clip, sign and mail the coupon and]

We Will Send You FREE This Book on "How to Build Rural Telephone Lines"

Bear in mind that **you have to ask** for this volume to get it. This book represents 100 profusely illustrated pages of vital facts, bound in stiff, cloth-covered binding. Apart entirely from the cost of printing and binding, this book represents the brain work of experienced telephone men—has cost us so much money that we really ought to make a charge for it. So long as the edition lasts, however, we are willing to send it FREE to every farmer who, by using the coupon, signifies that he is interested in the subject. This book is very frank, it tells you exactly what you can do, what you must do and what you cannot do; you will be interested in the straightforward way in which it comes out with vital information. Systems of rural telephone lines are spreading a network throughout the Dominion in the form of community-owned companies. Sooner or later someone will organize such a system in your locality. Why shouldn't **you** be the man to do it? In any event you owe it to yourself to know all there is to know about this subject. Better send the coupon NOW, while you are thinking about it.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

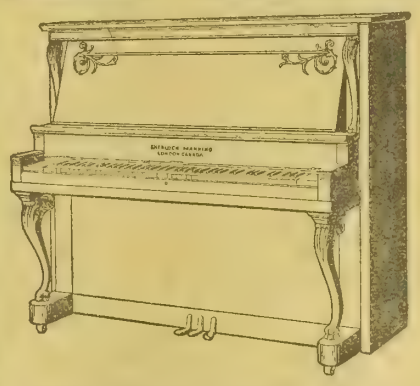
MAKE YOUR HOME HAPPIER !



Sherlock-Manning Louis XV, Style 80.
Several other handsome designs to choose from.

Don't imagine (now that you can afford a really **fine** piano) that you must pay a big price to obtain piano perfection.

Look at the Sherlock-Manning. Admire its handsome design and beautiful finish. Hear its rich, mellow, "singing tone." And realize that this delightful tone will not vanish, but will endure for long years.

And then—

Ask the price. No doubt you will be amazed at its smallness—if you have been 'pricing' ordinary pianos. But there's a sound reason for the less price, just as there is for the greater excellence of these superior instruments.

Catalogue "G" gives full particulars. We wish you'd ask for it.

But in order to **Know** what a really fine piano it is, you must hear the SHERLOCK-MANNING itself. We will be pleased to tell you where to go to hear it.

If you cannot see the Sherlock-Manning 20th Century Instruments in the warerooms, we will gladly demonstrate them at our fectory in London, or furnish full particulars upon receipt of a postal.

THE LEADING BREEDS OF SHEEP

Their Origin, Development and Characteristics.

Hampshire Down

By B. J. Spencer, B. S. A., Ottawa.

THE Hampshire Down and the Southdown are closely related. The ancestors of the two breeds inhabited the chalk lands of the South down counties of England since the time of William the Conqueror. The soil on the more easterly of these counties was thin and rugged, furnishing scanty herbage. The sheep raised on these were small in size, compact in form, and noted for the excellence of their flesh. These were the progenitors of the modern Southdown. As the chalk lands extended westward into Hampshire, Berkshire and Wiltshire, the soil became deeper and more fertile, affording better pasturage and heavier cultivated crops. The sheep reared on these lands were larger and coarser than the Southdowns. They were the progenitors of the Hampshire Down. Further west were to be found in those early days the horned sheep of Dorset and Somersetshire. Through generations the sheep along the border lines of these territories intermingled to some extent so that a well-defined division of breeds was impossible. Early writers state that the flocks of the more northern and eastern of the Hampshire district were more compact and symmetrical in form, with finer wool, than were those in the western portion, where white and speckled ears and faces and curling horns were not uncommon. Further east horns were unknown and the faces and ears of the sheep were of very dark colour. Those differences existed through the period from 1815 to 1835. About this time farming lands began to be enclosed and more careful attention was given to stock rearing. A class af sheep was desired that would thrive well on exposed pastures and when put on roots or other cultivated crops would take on flesh of a high quality economically. It was observed that where the blood of the Southdowns had long been mereged with their horned neighbors in Berkshire and Wiltshire, the flocks were best adapted to the ends desired. Improvement by selection and breeding was carried on by many farmers. For a time different sections had somewhat different ideals, and thus the breed lacked entire uniformity, but ultimately the best type was demonstrated and generally acknowledged. It was these animals, which are claimed to be a cross between the Southdown and the old Wiltshire horned sheep as well as the Berkshire Knot, that formed the foundation of the Hampshire breed.

Hampshire Ram.

Oxford Down Ram.

Foremost among the farmers who o undertook the establishment of the Hampshire breed was Mr. Humphrey, of Oak Ash, a man who unquestionably possessed the peculiar genius required in a first improver of stock. Contemporaries of Mr. Humphrey were Messrs. Lawrence, of Bulbridge, and Morrison of Fonthill. Mr. Humphrey's first pronounced improvement of the breed was effected by the introduction into his flock of a Southdown ram, bred by Jonas Webb, that won first prize at Liverpool about 1834. The difficulty arising from this cross was loss of size, and to obviate this only the largest of the Hampshire Down ewes that suited his fancy were selected for his breeding flock. These were bred to the most masculine and robust of the rams of his own breeding. This policy succeeded even beyond the hopes of Mr. Humphrey himself. Mr. Humphrey very seldom bought ewes, and never unless possessed of extraordinary qualities. A ewe thus bought, bred Jack Tar by a ram of famous strain. Such blood was used with great caution and never directly. Thus Jack Tar was given a few ewes and their ewe lambs were saved as dams for rams. It was, therefore only after being well mixed with the blood of the flock that new blood was allowed to permeate it.

The greatest possible care was exercised in selecting the animals that were to be perpetuated. Lambs were judged at birth, and those showing weakness or defects were marked for the feeding pen. Only the best of those remaining were placed in the breeding flock, all others being sent to the butcher, and none of this class were ever sold to other breeders.

In using sires Mr. Humphrey exercised the utmost caution. Lambs were tried on a small number of ewes and if their offspring promised well the ram was again used as a shearling and in subsequent years, but if not he was sent to the butcher. He never bought rams from others and never introduced stange blood straight into his flock. Mr. Humphrey died in 1868, when his flock was dispersed. Many of his rams sold from 40 to 60 guineas each, one of the keenest purchasers being Mr. Rowlings, whose methods of breeding had been the same as those of Mr. Humphrey. His success as a breeder lay in rigorous selection and careful introduction of the best obtainable rams, which were usually secured from Mr. Humphrey.

The Hampshire is the heaviest of the Down breeds, and is excelled in weight only by the Lincoln and theCotswold among the long-woolled races. Mature rams in good flesh shouuld weigh from 250 pounds to 325 pounds, and mature ewes 175 pounds to 225 pounds. It matures very early and for that reason is a favorite for getting heavy lambs for the spring trade. The ewes breed well and yield an abundance of milk. While the Hampshire stands well off the ground, it feeds up readily and carries a thick fleshy body of prime mutton. The fleece of the Hampshire is dense and about equal in fineness to that of the Shropshire. Well kept flocks shear fleeces of about 8 to 10 pounds of unwashed wool. The color of the head is a uniform black with a small top-knot which should consist of white wool. The ears are large, free from mottles and fine in

texture; they are carried lower than in other breeds. The shanks also should be of black color and free from mottles.

The breed is well adapted to either pasture or pen feeding. In its native home on many farms more than a breeding ewe per acre, besides large herds of cattle, are maintained in excellent condition in seasons when fodder is plentiful.

A society for the promotion of the breed and the regulation of a Flock Book was established in Great Britain in the year 1889, in which a similar organization was formed in the United States.

Oxford Down

The Oxford Down sheep is the product of a cross between the Hampshire Down and the Cotswold. The union was deliberately made by two or three distinguished breeders about the year 1833. It was the desire of these men to combine in one breed the diverse qualities of the long wool and the short wool classes of sheep. In great measure they were successful inasmuch as a large sheep of dark countenance and legs, with Down conformation, and wool of moderate fineness has been evolved. The founders of the breed were the Messrs. Samuel Druce, of Eynsham; John Gillett, of Braize Norton; William Gillet, of Southleigh, and Nathaniel Black, of Stanton Harbour. These leaders in the sheep breeding industry lived within half a dozen miles from each other and were joined in their enterprise by Messrs. John Hitchman, of Little Hilton, and J. L. Twyman, of Whitechurch Farm, Hampshire. It is claimed by historians that Southdown blood entered into the foundation stock, but since this breed and the Hampshire Down inhabited districts only a short distance apart, and the type of neither was well fixed at that early date, it may be safely inferred that neither was strictly adhered to in the search for suitable animals for the Down cross. In the first crosses the male was Cotswold and the female Hampshire Down, or in a few cases Southdown. There appears to have been a good deal of intermingling of blood before Oxford Down breeders settled into a line of their own. Mr. Druce decided that best results were secured when cross bred animals on both sides were employed. It was not uncommon for cross bred rams to be used on cross bred ewes that possessed the desired qualities; ewes that were undersized were bred to Cotswold sires, and Down rams were mated with the graded females of coarser type.

For many years the breed was known by various names. As late as 1853 they were known by some as 'Half Breeds,' and by others as 'Down Cotswolds.' Some four years later at a meeting of breeders held in Oxford the name "Oxfordshire Down' was agreed upon. Soon after this the more easily pronounced 'Oxford Down' designation was adopted. Since that time no outside blood was introduced, development and improvement being accomplished by perpetuation of carefully selected stock within the breed itself.

For many years the flocks of various breeders bore dissimilar characteristics indicated in fleece and face due to a preponderence either of the long or the short woolled parentage. This, however, had practically disappeared before the close of the past century. The speckled face has given way to an even brown which may vary slightly in shade without risk of disfavor. The finely cut profile and thinner nose, together with the long and moderately fine ear are undoubtedly vestiges of the Cotswold parent, while the dark face and comparatively close fleece are derived from the Down. Until recent years the upstanding characteristics of both parent breeds were conspicuous in the Oxford but the winners at the leading shows at the present day are of more compact form not unlike the larger type of Shropshire in general conformation. This more solid form has been striven for in the effort towards earlier maturity in accordance with the general tendency in the breeding of all meat producing animals on the farm.

The Oxford Down is one of the largest and heaviest of the Down breeds, approaching very close to the Hampshire in this regard. A well fleshed typical ram should weigh from 250 to 275 pounds and a ewe about 175 to 220 pounds at maturity. On account of its large size and the environment of its home the Oxford Down is better adapted to arable than rugged land. It matures early and fattens well on moderate feed. Its flesh resembles that of the Down in fineness of quality and even admixture of fat and lean. As a grading sheep the Oxford Down finds favor when increased size and good mutton quality are desired and the lambs are to be reared amid luxuriant pastures or rich forage. Ewes of the breed are prolific and good nurses. The wool is longer and coarser than that of the other Down breeds and is less dense over the body. In well kept flocks the average fleece, unwashed should weigh from 9 to 12 pounds. Well developed rams frequently exceed these weights at their first shearing.

Compared with the Shropshire, which breed they most resemble, the Oxford is larger in every way; its fleece is more open and longer at shearing time; its head and face are not so dark nor so completely covered with wool, and the head and the ear are longer.

Oxford Downs are to be found in almost every country where improved sheep are reared. They are numerously kept in almost all the provinces of Canada, the United States, Australia and South America.

Tidings From Stewiacke.

Editor Maritime Farmer:—

I feel that we have made a mistake in not using your pages more in exchanging ideas and obtaining more information that you are more than ready to supply.

First as to crop conditions. The season for the most part has been unusually favorable, warm, dry weather prevailing during the latter part of April and May, and gave the farmers an excellent opportunity to get their seed into the ground—grain came up quickly, and made good progress but there was scarcely enough rain for a full crop of hay, and the grain is heading out rather early. The grass ripened before the farmers were prepared to cut it and much of it was too dry before it was harvested. The early winter was extremely hard on newly seeded down uplands and the clover will be light most everywhere.

Fruits of all kinds blossomed abundantly, and the small varieties, both wild and cultivated have been abundant.

The larger fruits are suffering somewhat from want of rain, but we have had some copious showers, though local in extent, that will help out amazingly.

Our society, organized in 1900, has had good success financially though it is not the instrument for good that it might be. Our annual dues have never been more than one dollar per member and the membership has not at any time been large, but the system we adopted in keeping our bulls, largely accounts for its success.

We say to our members in any given locality if you will keep a bull we will buy you one, but the animal must pay for its keeping. Those who keep him were allowed to charge members of the society fifty cents for service and those outside one dollar. This plan has generally worked well, but some difficulty has been experienced in getting the animal kept in proper condition.

Our members are generally alive to the fact that it is not advisable to mix the breeds. Conditions vary in different localities, and different breeds are kept to supply local conditions. Where dairying predominates, Guernseys are more generally kept, but Holsteins are preferred by some.

For beef, Shorthorns take the lead though the quick maturing Herefords have some advocates. Not enough attention is given to pigs and poultry that their importance demands, though where help is scarce many lines cannot be successfully followed.

Two years ago we had quite a successful exhibition, but as it was the first it was not what the one last year was at Shubenacadie in which we were interested, or what the one here on the 26th and 27th of September promises to be. The people of Truro are taking hold of this one in a very encouraging manner, and all through the Stewiacke valley and in East Hants the farmers are planning on doing their best along the different lines. The Committee are alive to the situation, good buildings will be provided and suitable grounds are adjacent.

Although only Colchester and East Hants can compete, yet the management will be happy to provide accommodation for any stock or farm machinery that any one wishes to exhibit or offer for sale. Application should be made early to the undersigned secretary, who will do all in his power to provide room for any firm that will come along.

These local fairs, where farmers can take a day off, meet together, compare notes, see what is being done, and get home again with little expense of time or money, appleals to the majority of farmers in a much more favorable light than the more extensive central shows.—A. M. Shaw, Stewiacke, N. S.

A Profitable Agricultural Meeting at Jemseg.

Editor Maritime Farmer:—

A very interesting and most instructive agricultural meeting was held here this month, under the management of the Cambridge Agricultural Society, No. 29. Mr. Elliott and his daughter, of Galt, Ontario, Mrs. Dunback, Fredericton, and Mr. Jones, Sussex, were the speakers.

The ladies who attended the meeting in the hall during the afternoon to listen to Miss Elliott and Mrs. Dunback were much interested. The object of the meeting was to illustrate the proper methods of cooking and doing several other things in connection with household duties. The gentlemen, who occupied a sheltered nook, just outside the hall, discussed the best methods of farming.

The Secretary for Agriculture, Mr. Hubbard, in opening his address was pleased to find the farmers anxious to learn something of the different modes of farming. This society, whicch was one of the oldest in the Province, was pot patronized as it should be. In horse raising they were negligent. "You have the opportunities of raising a better class of horses" he said. "King's College", a horse in which some of you have an interest has proved to be one of the best horses ever imported into this Province. His colts demand higher prices than those from any other sire in this vicinity. At present it seems very hard to get the farmers to take an interest in agricultural societies. Many think if they don't have an exhibition every fall that it is not worth joining. The money received for prizes does not amount to much; it did 'not pay for half the time it takes to get things to and from the exhibition grounds. The money spent in purchasing pure bred stock is more judiciously spent than in any other way, as it gives the farmer a chance to get a better class of cows, steers, horses, hogs and sheep and in this way the farmer and country are built up.

Another very important question brought up during the afternoon meeting was: Why New Brunswick did not have an Agricultural College? Mr. Hubbard strongly urged the farmers' sons to attend an agricultural college, which was right in every sense. We farmers have been going along in the same old rut that our fathers did. In many cases, our fathers took everything out of the soil and returned nothing. The consequence is a legacy of worn out fields. Just here is where an agricultural school is most profitable as it teaches the different modes of farming and gives farmers ideas about their work which they never had before. In this way it brings the people up to a better standard of living. I would urge that the farmers join together in trying to get an agricultural college for this province.

Mr. Jones, who spoke on poultry raising as a practical man gave his experience, which was listened to with much interest. He strongly advised the farmers to co-operate and work together and they would be sure of greater success. He told the farmers how to care for poultry, which was one very important point and also the preparing of fowls for market. When asked how the large profits of the middle men could be avoided, he said by all means to co-operate and ship direct to the buyer This plan would give the farmer more money for his produce and in many cases be cheaper for the consumer.

Mr. Elliott, during the afternoon, drew attention to soil cultivation, strongly advocating that plowing and harrowing to be done more thoroughly. In many places plowing is not done as it should be. The furrows should not be less than five inches deep and as much deeper as possible. This gives the harrows a much better chance to work up a seed bed, and the seed when planted, will take root much quicker and the results at harvest time will be much greater.

A joint meeting was held in the evening. The hall was so crowded that large numbers had to remain outside. C. L. Slipp, president of the Society acting as chairman, gave a word of welcome to the speakers.

Miss Elliott spoke on the subject: "What Young Canada Reads," strongly advocating a high standard of literature and urging parents to start their children in the best class of reading. Her address was very forceful and greatly appreciated.

Mr. Elliott made a strong plea for the boy on the farm, urging the parents to allow the boy more privileges.

After singing the National Anthem

ice cream and cake was served.—F. C. Nevers, Secretary Cambridge Agricultural Society.

Notice re Exhibition of Selected Seed Produced in the Maritime District in 1911.

Official notice is hereby given that the Canadian Seed Growers' Association will again offer substantial prizes, as per prize list given below, for seeds grown, selected and exhibited in the Maritime Provinces in 1911 in accordance with the regulations adopted by that organization.

As intimated in a letter issued on April 1st, the standing seed plots of those members who have advised us that they are operating will not only be inspected, but they will be judged as well, the scores awarded being retained until selections are taken from the plots and forwarded as exhibits to be shown in connection with the Maritime Winter Fair at Amherst, N. S. This fair will be held in December, 1911. Here they will again be judged, the combined scores determining the final awards where possible. This arrangement, which concerns the older members more particularly, provides for the giving of due recognition for careful field work on the part of the various growers and at the same time enables the judge to place the awards more fairly than he otherwise could. Those whose plots are not inspected will not, however, be debarred from competing.

In this competition no exhibitor is allowed to compete with more than one variety of any one kind of crop, except in the case of corn and potatoes, neither is it permissible for any exhibitor to compete with the same variety in more than one class. All grain should be shown in clean, standard sized sacks.

The prizes offered in this competition are indicated in the following classification:—

CLASS I.—SHEAF EXHIBITS.

Each sheaf shall consist of approximately 500 plants taken from the Hand-Selected Seed Plot or other area and showing the full length of straw (not including the roots) and heads of grain. In addition to this sheaf and in connection with it five complete plants with roots attached and showing the average stooling character of the sort, are called for in wheat, oats, barley and peas.

Open only to bona fide members who are not exhibiting in other classes.

1. Spring Wheat (sheaf of Red Fife, White Fife or Marquis.)
2. Spring Wheat (sheaf of any other variety.)
3. White Oats, (sheaf of any variety).
4. Black Oats, (sheaf of any variety.)
5. Six-rowed Barley (sheaf of any variety.)
6. Pease (50 plants of any variety.

The following three sections are open to new beginners who have sent satisfactory reports for the current year to the Secretary of the Association prior to November 15th: Sheaf Spring Wheat, White Oats and Six-rowed Barley.

CLASS II.—GROUP EXHIBITS.

Open only to bona-fide members who are not exhibiting in other classes provided by this Association.

Each group shall consist of the following parts:—

(a) A sheaf of approximately 500 plants (roots not included), together with five complete plants showing average character of stooling and taken from the Hand-Seleced Seed Plot.

(b) One and one-half bushels of cleaned seed from a multiplying field and which must be representative of such seed as may be held for sale by the exhibitor as follows:

Spring Wheat, White Oats, Black Oats, Six-Rowed Barley, Pease.

CLASS III.—BEST 1½ BUSHELS CLEANED SEED FROM A MULTIPLYING FIELD.

Open only to those members not exhibiting in the other classes provided by this Association. This seed must trace clearly and distinctly to Registered seed and must have been inspected when growing by an officer approved by the Association. It must further constitute a representative sample of at least 10 bushels offered for sale by the exhibitor as follows:

Spring Wheat, White Oats, Six rowed Barley.

CLASS IV.—BEST 10 EARS OF CORN FROM HAND SELECTED SEED PLOT ONLY.

Any 8-rowed variety Flint, any color.

Any 12-rowed variety Flint, any color.

CLASS V.—BEST BUSHEL OF POTATOES FROM HAND-SELECTED SEED PLOT.

Round White Type, Long White Type, Rose Type.

CLASS VI.—BEST BUSHEL OF OF POTATOES FROM MOTHER CROP BY NEW BEGINNERS.

Only open to those new beginners who have sent satisfactory reports for the current year to the Secretary of the Association prior to November 15th.

Round White Type, Long White Type, Rose Type.

CLASS VII.—SPECIAL SWEEPSTAKES TROPHY.

Awarded by The Steele Briggs Seed Co., Toronto, Ont.

The member making the most creditable showing of selected seed will be awarded a special trophy in the form of a handsome Silver Cup, donated by The Steele Briggs Seed Co., Toronto, Ont. This cup is not to become the permanent property of any grower until won by him three times, not necessarily in succession. Between exhibitions this trophy may be held by the last winner whose name will be engraved thereon each year.

CLASS VIII.—SPECIAL COMPETITION FOR BOYS AND GIRLS.

Any boy or girl not less than 12 or more than 18 years of age, resident in the Maritime Provinces, is entitled to compete for special prizes offered by the Canadian Seed Growers' Association at Amherst.

The rules governing this competition are as follows:—

(1) The exhibit shall consist of the following material:—A sheaf of wheat or oats as the case may be, composed of a sufficient number of plants to make a compact sheaf of approximately 8 inches in diameter. These plants are to be selected by hand from the standing crop and must show full length of straw (roots not included). In addition to this sheaf a gallon of threshed grain from the same field or plot is called for.

(2.) A card must be attached to each exhibit, giving the name of the exhibitor, her or his address and age. The name of the variety of grain shown must also be given.

(3). In placing the awards the judge will consider the following points: (a) Type, uniformity and character of head. (b) Character of straw. (c). Quality of grain in the heads. (d) Quality and uniformity of grain in the sample.

(4) All exhibits will be arranged free of charge and at the close of the Fair will be returned to the various exhibitors as follows: Wheat, oats.

SWEEPSTAKES PRIZE FOR WHITE OATS.

The boy or girl having the best exhibit of White Oats in the above competition will be awarded a handsome Gold Medal. This medal is donated personally by Dr. Jas. W. Robertson, President of the C. S. G. A., and is worth competing for.

By way of further encouragement, the Association agrees to refund all transportation charges over $1.00 on all exhibits in the above classes. All exhibits should be sent to the Fair by express peepaid and will be returned by freight collect. At the close of the Fair, and as soon as the exhibit has been returned, each grower is requested to send all transportation bills to the Secretary of the Association at Ottawa, in order to receive any refund to which he may be entitled.

Exhibits of hand-selected plants should be carefully wrapped in paper and shipped in some suitable form of a box. Each exhibitor is also advised to enclose an extra tag containing name and address in all sacks. All exhibits should be addressed to the Seed Department, (C. S. G. A. Section,) Winter Fair Building, Amherst, N. S.

The general rules governing the Seed Department of the Fair may be found in the Official Premium List, a copy of which will be sent you later. You will also notice that the numbering of the classes in the above booklet will probably be different from that herein given. In making entry please follow classification as given in booklet.

Each member should consider it his duty, as a moral obligation, to send an exhibit of some sort to this exhibition. We trust that you will do your share in making the next Fair a grand success.—L. H. NEWMAN, Secy. C. S. G. A.

Great Race Meet and Splendid Exhibition Attractions.

The great Nova Scotia Provincial exhibition will open to the public on August 30th, and on that afternoon there will commence a programme of races, ninety-five different horses and horses have been entered that has ever been here before in the history of Nova Scotia. There are seventeen races, ninety-five diffegent horses and a grand total of one hundred and sixty-five enteries, which include splendid specimens from the United States and the best in Eastern Canada. The races will come off daily and the programme as published will be strictly adhered to.

The aerial navigator who is to give daily air flights from the Exhibition Grounds will arrive in Halifax in a few days to prepare for his work. Flights will be made every day when the wind does not exceed twenty knots an hour, and many thrilling performances will be witnessed. In addition to this there will be seven splendid vauderville acts to be put on in front of the Grand Stand, afternoons and evenings, and constituting a performance unparalleled in point of merit and surpassing anythinb hitherto seen in Nova Scotia.

All the regular features of the exhibition will be on a splendid scale. Bands of music will be in attendance, and the rates of transportation to Halifax for the exhibition have been arranged at exceedingly low rates.

Some June Contrasts.

Many grade cows are making good records this season. One near Cassel, Ont., has given over 200 pounds of butter fat in three and a half months.

In the cow testing associations at Warsaw, Ennismore, Cassel and Tayside, Ont., the average yield of all cows tested for June is over 35 pounds of butter fat.

Eight associations in Quebec averaged over 30 pounds of fat per cow.

But a good many herds in Ontario and Quebec average less than 700 pounds of milk and 24 pounds of butter fat during June.

In Prince Edward Island the highest average yield for June is at Kensington, where 150 cows, included in the "dairy record centre", there give 787 pounds of milk, 3.7 test, and 30 pounds of fat. Included at this centre are several individual cows giving over 900 pounds of milk and 35 pounds of fat. One of the best yields is from a 7 year old grade Shorthorn giving over 1,120 pounds of milk and 40 pounds of fat. But hard by these good records are found poor yields of only 500 pounds of milk and 18 pounds of fat from six to seven year old cows that freshened in April and May.

Between yields of 40 and 18 pounds of fat in one month there is too great a difference to be overlooked. It is all the difference between a very satisfactory return, and no adequate payment whatever for all the energy, time, feed and care expended on cows that are not capable of making money for their unfortunate owners. Conserve your energy by keeting better cows. You cannot afford to keep a herd of only medium capacity.

Cow testing pays abundantly, for it shows which cows are making a good profit, and again which cows cannot by any strength of imagination be considered in the same category.—C. F. W.

Wire Cuts.

Farm animals are frequently cut with wire. When the injury is severe, it will pay to employ a veterinarian to dress the wound. Where the services of a competent veterinian can not be obtained, the farmer will have to handle the case himself.

The first thing to do, of course, would be to stop the hemorrhage. This can be accomplished by a tight bandage of clean, white muslin, applied either over the wound or above it. A thread may be run under the artery by using a needle, and tied. Do not use flour, dirt, cobwebs or any thing of that sort on the wound; they are unnecessary and may produce a dangerous infection.

Having checked the bleeding, remove the clots of blood and cut off the ragged edges of tissue with clean shears. A pan of antiseptic solution should be provided, and one of the best antiseptics on the farm is creolin. Add a teaspoonful of this to a pint of water that has been boiled, and use it on the wound two or three times a day. Place knife or shears in this solution, and wash the hands before beginning to dress the wound. See that there is good drainage from the wound and do not tie the wound up with covering of any kind.

In about one week it may be well to change to dry dressing. In the meantime it will be well to get in communication with some veterinarian who will advise you in the case from this time on.

I did not mention sewing up the wound, for the reason that in ragged cuts it is better not to do so.

Remember that the principal thing is to get the wound healthy at the start and then it will heal with very little interference.

THE MARITIME FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

UOR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

Photographs of farm life, when accepted, will be paid for at the rate of 50 cents each, Communications on all subjects connected with farming and stock-breeding are invited. The publishers will pay a reasonable rate for matter of practical value and for agricultural news. Photos and matter not accepted will be returned on receipt of postage.

RATES FOR CASUAL ADVERTISEMENTS.

2 inch—First insertion 75 cents; 2 inches—First insertion $1.50
3 inches—First insertion $2.25.

TWO KINDS OF SMITHS.

The following editorial appeared in a recent issue of Heard's Dairyman and is passed on to our readers. Which Smith represents you ?

In a certain farm neighborhood in Wisconsin there once lived two farmers. There farms joined, as the saying is. Both of the owners were named Smith, although they were unrelated. But they and their farms were so totally unlike that the neighbors fell into the habit of designating them as Slow-to-catch-on-Smith and Quick-to-catch-on-Smith. Finally for the sake of brevity, they were called Slow and Quick Smith. The fact that their lives and methods of farming were so typical of two distinct classes of farms makes a brief study of the two somewhat instructive as an example of how the mind makes the man and finally the farmer.

Both men were raised in Pennsylvania of good German stock, yet what a difference there was between them ! Both came to Wisconsin after the Civil War and, so far as we can learn there was but little difference in their means at the start, except that Slow Smith had money enough from his father's estate to nearly pay for 160 acres of land while Quick Smith started with 40 acres paid for with money he had saved as a hired man.

Quick Smith always declared that he owed his success to the fact of having worked for ten years with one of the best farmers in the old Keystone state, a man who was a bright, well read farmer in every respect.

Neither of the Smiths had any education beyond that of the country district school where they barely learned to read, write and cipher as far as decimal fractions. But after 25 years of living side by side, the contrast in their circumstance, in their intelligence, in the character and method of their farming, in their farm houses and other buildings and the fertility of their farms, as well as the quality of their live stock, was so marked as to become a matter of general comment.

After studying them awhile one day, we made up our minds that the neighbors had struck the secret and reason of this difference in the names they had applied to them. Slow Smith was truly slow in everything. He had learned but little since he got his first ideas of farming from his father. He was so conservative, so slow, that he was suspicious of every improvement, every new idea, every new kind of a machine so that it was noticed that he was about ten years behind his neighbor in the adoption of any change for the better and then most of the time he would do the thing in a patchy, half-way manner, showing that he did not comprehend the principle of the thing.

On the contrary, Quick Smith was always on the alert to study out some better way of doing things. He was a great reader on farm questions. This habit he learned from the man he worked for so long in Pennsylvania. Then, two, he had a quick, active mind, and he kept it active and strong by feeding it with progressive ideas.

Originally the quality of the soil of the two farms was about alike, a strong clay loam which readily responds to good treatment.

Slow Smith had a great contempt for reading farm papers and books. He used to say that "he didn't want any book farming in his,' that the other Smith wasted too much time and money and that sort of thing.

Now all this time Slow Smith's farm was running down. He made no study of the soil, for he shut out all light from his mind on that subject. He ascribed the failure of his crops to the bad season. His cattle were of the same scrub stock he started with except that he would occasionally buy a cheap, grade Shorthorn bull. He said "Shorthorns were good dairy cattle for him." He was in debt to the extent of a $3000 mortgage on his farm.

Quick Smith was the exact opposite of Slow Smith. He had a splendid herd of grade Jersey cows, for he had always bought the best bull he could get, paying at one time $350 for one exceptionally good bull. He had a big machine shed filled with the best improved machinery, for he said "man help is scarce and high and we must do everything by horse power and machinery we can.' But he took good care of his machinery. Slow Smith didn't. You could find plows, mowers, horse rakes, and a reaper, even out in the fields all winter long. He said he couldn't afford to build a shed.

Now to sum up—Quick Smith owns a 250 acre farm, well stocked, in fine condition, with splendid buildings, plenty of machinery and $2,500 in the bank and he owns the mortgage on Slow Smith's farm. He has never said that he "couldn't afford" anything that made for the betterment of his farm.

Slow Smith has always followed the idea that he "couldn't afford" this, that or the other thing. "Get along without it as long as you can" has been his maxim. He can't afford papers or books. "They are no good," he said. Slow Smith has practically wasted his whole life. He has grown smaller in mind and fortune.

Quick Smith has gone ahead, built up his mind and judgment with good ideas; and good ideas, put into practice, have made him the man and farmer he is to-day. Both men represent two classes of farmers.

Now just a word as to the cause of these two widely differing results. There is a cause for every result. What made Quick Smith prosperous ? The use of his mind. He proposed in the beginning to gather to himself all the useful knowledge he could get.

He could look around him and see the effect of poor farming everywhere. He could see just as well that the most successful farmers were the ones who made use of the best knowledge. So he proposed to get that knowledge. Part of it must come through reading. So he became a reader, and as he read, and studied, and worked, he grew in knowledge.

It is no new way. It is the way every man who succeeds in anything must travel in. His mind became quick to preceive right principles and right methods.

Why was Slow Smith so slow ? Because he had educated himself by lack of knowledge to be slow. All unconsciously he had trained himself to think slow, work slow, and be slow. His mind was blank, empty of right knowledge. It was like the soil, losing the power to produce. In both soil and mind, where we put nothing in we will take nothing out.

THE FARM INFLUENCE.

So large a part have men of country birth and breeding played in the large affairs of the world, and not less so in the successful conduct of the ordinary business of the cities, that we have come almost to the belief that the great majority of men who are successful in business and professional life came out from the farm. So common is the acknowledgment, "I was born and raised on a farm," that we expect and are not surprised to hear it from men of all walks and conditions in life, and this fact has an important bearing upon the "back to farm" movement.

The back to the farm movement is a real thing, in spite of the skepticism of the city jay who thinks that within the confines of paved streets and sidewalks is contained all that is desirable or profitable in life. The back to the farm movement is a real thing. in spite of the discouragement of unprogressive farmers and the opposition of a few misguided snobs, and the infiuence of the man in business or professional life who was born and raised on a farm" is contributing to the spread and the enlargement of the movement.

So common has it become for the man who has made money in business in a city to buy a country place, perhaps to repurchase the old and ancestral home, where he and his family may spend a portion of the year or even make a permanent residence, that while worthy of remark, the record is but that of an ordinary occurrence. But this is far from being the extent or even the most important feature of the back to the farm movement. The strength of the movement is in the men and women who have gone and who are going out from the cities to make homes among the fields and hills of God's good country and to take up the ever fascinating labor of wresting from the soil that which is necessary for man's subsistence and comfort.

This movement from the city to the country has been going on for more years than most of us have any realization, but which we are beginning to know through the frequently recurring recital of the successes which such men and women have made. More frequently than not, these successes have been made through the overcoming of difficulties which would have discouraged those who were not brave of heart and determined of mind, and we would not pretend even to believe that there have not been some who have been discouraged and disheartened by these difficulties and the failures which they have made, and have turned back.

That so many have succeeded and that success has been so wonderful and satisfying in the great number of cases, demonstrates that there is a sane and safe idea back of the back to the farm movement. What so many have done, many others can do, and the failure of a few or even of many may not be taken as an indication of the unwisdom of the movement.

THE INDIFFERENT DAIRY MAN.

We often see the economical dairy farmer who thinks it a waste of time to read or talk about his business, who refuses to buy books or subscribe for papers devoted to his calling, and gets along with a scrub bull and worse than scrub cows. This man often gets back 39 cents for each dollar's worth of feed, and works for nothing, boarding himself. He is no better and no worse than those people in the towns and cities who barely make a sliving.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Six Tons to the Acre.

Mr. S. Stewart, of the Aylmer Road, Ontario, has 4 acres of alfalfa that grows like a weed; as soon as it is cut down once it springs right up again. He cuts it three times a year, and estimates that he gets 6 tons to the acre. His neighbors call the alfalfa a weed, but it is a good one. On one part of the field there is a poor sandy hill that never produced a paying crop before, but here the long tap roots go down until they reach the moisture and this otherwise worthless land is now producing good paying crops. He sowed 7 acres more this spring with oats, and has a good catch, which is well inoculated. Owing to the prevalence of sweet clover no artificial inoculation seems to be necessary in this favored district.

Mr. Stewart is authority for the statement that a man came into the district and bought 50 acres of rough land near where he lives and sowed it all to alfalfa. The neighbors all laughed at him, but this year he has filled all his barns with alfalfa hay and is selling the second cutting to his neighbors at good prices. One of the men who laughed at him has 200 acres, and cannot grow enough feed for his cows, was glad to come and buy the second cutting of alfalfa and harvest it himself.

Mr. William Stewart, his son who recently returned from taking a year's course at McDonald College, is of the opinion that with plenty of good ensilage and alfalfa hay that it will not be necessary to feed any meal to the cows. He considers that it is equal pound for pound to bran.

It is the best feed a farmer can grow. You should just see the cows eat it, he said with enthusiasm.—Ottawa Valley Journal.

Alfalfa Dies Out.

Alfalfa plants gradually die out so that a very thick stand may show a much smaller number of plants per unit area two or three years after seeding. Some notes have been taken on this point at the Kansas Experiment Station. In the spring of 1903 an area of ten feet square was staked out in an alfalfa field seeded in the fall of 1902. On June 18, 1903, 1133 plants were counted in this plot, or an average of 11.33 plants per square foot. It will be observed that this count was made some six months after seeding. On June 29, 1906, a recounting of this field showed only 670 plants, or 6.8 plants per square foot. On August 9, 1907, the number of plants counted was 403 or 4.03 plants per square foot. The decrease in the number of plants between the first and last countings, a period of fifty months, was 730 per 100 square feet, which is a loss of 64.4 per cent.

Another plot seeded in the spring of 1904 contained 1130 plants on June 20, 1904, on an area five feet square, or 45.2 plants per square foot. On May 1, 1905, the number of plants in the plot had been reduced to 403, or 16.1 plants per square foot. On May 25, 1908, the plot contained only 148 plants, or an average of 6 plants per square foot. Only 13 per cent of the plants counted in he original seeding survived four years after seeding. Although the number of plants as shown by these counts was greatly reduced, yet these fields did not decrease in producion and the stand of alfalfa was, apparently, as good as ever. This is explained in this way: As the plants decrease in number, those that remain increase in size, sending out more shoots or stems, thus occupying the space. In time, however, as the field grows old, the stand of alfalfa becomes too thin to produce a maximum crop, when it is usually advisable to break up the old field after seeding down a new field.

Cultivation of Alfalfa.

Reference has already been made regarding the importance of thorough preparation of the soil before seeding alfalfa. In the opinion of the writer three-fourths of the failures to grow alfalfa successfully have been due to lack of soil cultivation and to wrong methods of preparing the seed-bed and sowing the alfalfa. The cultivation of alfalfa after the plants are well established may also benefit the crop.

It pays to cultivate alfalfa just as it pays to cultivate corn and other crops. The next season after seeding, a heavy straight-tooth harrow may be used in the spring to loosen the surface soil and, as soon as the alfalfa has become well established, the field may be disked or cultivated with the spike-tooth disc harrow regularly each spring and perhaps during the season after each cutting. By thorough cultivation late in the season, after the third or fourth cutting, it is often possible to destroy many weeds such as crab-grass and foxtail, the great weed enemies of alfalfa.

Alfalfa a Cheap Fertilizer.

Some farmers make objection to using alfalfa as a rotation crop: "The seed costs too much and it is so hard to get a stand." Many farmers have found it difficult to get a stand of alfalfa, but the failures have often been due to poor seed or to errors in preparing the seed-bed or in sowing; and as a rule these mistakes may easily be corrected. With good seed, a proper seed-bed, and land adapted for growing the crop, a careful farmer should be almost sure of obtaining a successful stand of alfalfa as the average farmer is of getting a stand of wheat or oats.

Good alfalfa seed is costly, but if any reader can inform the writer of a cheaper fertilizer than ten or fifteen pounds of alfalfa seed per acre, he would like to secure the information. Consider: Twelve pounds of alfalfa seed at 15 cents per pound, or $1.80 per acre, the value of five loads of manure or of 100 pounds of commercial fertilizer; and after valuable hay crops have been removed from this acre for four or five years in succession this alfalfa will have been worth more to the soil than fifty loads of manure or several tons of commercial fertilizers.

How Alfalfa Increases Soil Fertility.

Alfalfa adds to the fertility and increases the productiveness of land in several ways. The bacteria which live and multiply in the tubercles that grow on the roots of the alfalfa plants take nitrogen from the air that passes through the soil, doubtless using the nitrogen as a food and changing it in such a way by this use that the nitrogen becomes available as food for the alfalfa plants, or the death of the bacteria allows their substance to be absorbed by the plant. Through this use of the nitrogen of the air alfalfa produces not only large annual crops of nutritious fodder, but also by the large root growth of the plants, the death of the bacteria, and the destruction and renewal of the tubercles of the roots, the nitrogen supply of the soil is actually increased by growing alfalfa. Thus the soil becomes richer in nitrogen after alfalfa has been grown on it for a few years than it was before alfalfa was planted.

The continual dropping of leaves also adds to the humus and nitrogen of the soil.

Dr. William P. Headden, of the Colorado Experiment Station, estimates that the fertilizing value of the stubble and six and one-half inches of alfalfa roots plowed under is about twenty dollars per acre, while the value of the stubble and the entire root system is not less than thirty-five dollars per acre.

Dr. C. G. Hopkins, of the Illinois Experiment Station, determined from his experiments that "at least 160 pounds of atmospheric nitrogen was fixed (added to the soil) during the year." Likewise, "the percentage of nitrogen is much higher in the crops from the inoculated plots, the percentage of protein averaging 12.2 per cent. in the dry matter of the uninoculated crops, while 16.84 is the percentage of the inoculated plots."

For the single cutting, May 28, when the determinations were made, the yields in dry matter per acre were 1340 pounds and 2720 pounds, respectively; or the inoculated plots gave more than double the yield of the plots which were not infected with the alfalfa bacteria.

Estimates made at the New Jersey Experiment Station indicate that the plant-food gathered by an acre of alfalfa in two years was equal in nitrogen to that contained in 3500 pounds of nitrate of soda; in phosphoric acid to that contained in 600 pounds of superphosphates; and in potash to that contained in 1200 pounds of muriate of potash; the whole having an actual value, if these fertilizers should be bought on the market, of $124.

Practicability of Soil Inoculation.

The inoculation of fields intended for alfalfa with nitrogen-gathering bacteria is indeed a practical procedure. To obtain a good crop without these bacteria is impossible unless the soil is very rich in nitrogenous materials. Moreover, if the legume bacteria are not present the alfalfa crop will leave the land in a somewhat depleted condition. The soil will be left more deficient in nitrogen. At the same time, care should be exercised in maintaining other conditions which are essential for a good yield of alfalfa. For instance, if the soil is too acid or too alkaline the alfalfa will not do well, and moreover, the nireogen-gathering bacteria will not be able to grow.

The farmer should not expect the nitrogen-gathering bacteria to work miracles. Generally considered, the soil should contain other elements than nitrogen, as potassium and phosphorus, which are essential for the growth of alfalfa plants. Neither can one expect inoculaeion with the bacteria to overcome the hindrances to a crop which may be brought about by improperly cultivated ground, or a bad season.

The conditions influencing successful soil inoculation with legume bacteria are summed up by Ferguson, of the Virginia Station, as follows:

WNEN INOCULATION MAY BE BENEFICIAL.

1. On poor land that has not previously grown legumes.
2. On land that produce poor crops of legumes and where, upon examination, the roots fail to show the presence of nodules.
3. Where the legume to be planted is of a widely different species to the ones previously planted on the land.
4. Where the land has previously produced a lot of legumes, possessing nodules which, instead of being beneficial, acted as parasites. Good results may be obtained from the use of pure cultures when a field which has previously grown good crops of legumes begins to give evidence that, all other conditions being the same, it is not producing the hignest yields The cause may be that the bacteria already in the soil are losing their virulence, and the only way to be certain of this is to try inoculation and note results.

WHEN THE INOCULATION WILL BE A FAILURE.

1. When the directions for preparing the solution are not carefully followed.
2. When the soil is too acid or too alkaline to permit the development of either plants or bacteria.
3. When the soil is deficient in other necessary plant foods, such as potash and phosphorus, as well as nitrogen.

WHEN INOCULATION IS UNNECESSARY.

Since the only purpose in adding the bacteria to the soil is to furnish nitrogen to the plants in an available form, usually with root nodules, it is evident that where the organisms are already abundant and the crop is thriving, but little benefit can be expected from an additional inoculation. Neither is inoculation necessary where the soil is already very rich in nitrogen, nor where it is already full of nitrogen-fixing bacteria.

Pasturing Alfalfa.

It is usually considered a dangerous practice to pasture alfalfa. While stock under some circumstances can be pastured on alfalfa for weeks without injuring them, sooner or later some of the animals are almost sure to die. There are a great many plans recommended to make possible the pasturing of alfalfa. Some have the alfalfa planted in strips, with strips of grass between; others claim that if cattle have access to other kinds of food or pasture adjoining the alfalfa field that there will be no danger from pasturing the crop. Others have a theory that if the stock is turned onto the alfalfa pasture in such a manner as to gradually accustom them to eat the alfalfa, the practice of pasturing it will be successful. In view, however, of the present knowledge, it is a dangerous practice, and one which must always be taken with considerable risk. Besides, the pasturing of alfalfa, especially if it is not done judiciously, has a tendency to destroy the alfalfa plants.

HORTICULTURE

High vs. Low Heading.

The advocates of the low-heading system base their claims of superiority on the following grounds. A low-headed tree can be more easily sprayed, and the fruit can be more easily gathered from it. There is no question that both these claims are well founded, and the low-headed tree has the advantage in both of these respects. That they can be more easily pruned is also true, but is offset by the fact that as the tree increases in size it will require much more pruning. A low-headed tree presents a more attractive appearance. This is purely a matter of personal preference and cannot be discussed. It may be brought into bearing in a less number of years. This is admitted. It will produce more fruit. This is questioned and is worthy of an extended discussion.

A low-headed tree certainly will produce more fruit during the first few years, perhaps twenty or twenty-five, but as it increases in size, either the lower limbs will drag upon the ground and become unproductive, or by pruning the trees will have developed into the vase form. In either case the head will be much smaller. There will be much less apple producing surface, and in consequence a low-headed tree must eventually yield in point of production. This is thought to be offset by the fact that low-headed trees may be grown much closer together and thus increase the yield per acre. And the foremost horticulturist of the world has lately planted an orchard which shall consist of several thousand trees planted but 16 feet apart each way and headed to within one foot of the ground.

The opponents of this system admit that while during its infancy a low-headed, close-planted orchard may yield a greater profit per acre, yet as the trees increase in size this close planting will so seriously interfere with the health, vigor and vitality of the trees and the development of the fruit that eventually such trees will fall far behind in productiveness and profit. They believe that when the broad spreading dome of a well shaped, high-headed tree attains such a size that it occupies all the space allotted to it, that tree will produce all the fruit that the soil can yield, and no tree can produce more.

They believe that a high-headed orchard can be cultivated and fertilized more easily than a low-headed one. And this is true, no matter what system of cultivation may be practiced. They believe that when a high-headed orchard is pastured, or when live stock breaks into the enclosure, less damage will result from the browsing of the limbs and twigs. This is granted. They also make the assertion that forcing the trees into early bearing causes premature decay and death. This is vehemently denied, and here the matter rests.—Country Gentleman.

Tools for Cultivation.

The orchardist should at least have a two-horse and a one-horse plow, a disc or cutaway harrow, a spring-tooth and a spike-tooth drag. The last two tools are now made in one and so arranged that either or both can be used at one time, which makes a very handy and useful tool. The cutaway or disc harrow, will work up hard ground, and often answer for a plowing, and is an excellent tool for cutting up ground that has become somewhat weedy or grassy, or grew a cover crop the previous season which died down dufing the winter. It is often of use in cutting up sod ground before plowing. The one-horse plow is convenient in finishing up lands next to the trees, as it can be set up so as to run shallow and close to the trees while the horse walks to one side. Other tools may be desirable, such as a roller or harrow, but those mentioned above are considered more essential. One-horse cultivators are convenient in working close to young trees, as one can get closer than with a harrow and with less danger of injuring the the trees.

For small fruits, in addition to the list given above, there should be a two-horse cultivator, if there is much cultivating to be done, as it will break up hard ground better than hand cultivators and do faster work. A hand cultivator with small shovels adjustable for depth and for throwing to or from the row, is a necessity, also a spike tooth cultivator, adjustable sidewise and in height by means of levers, and arranged so sweeps can be attached for cutting out weeds or grass or suckers from raspberry or blackberry rows. An adjustable springtooth cultivator is also very convenient.

For hand tools a good supply of sharp hoes should be in readiness. They should vary in width from three to six or seven inches, and it will be found convenient if the narrow ones have two prongs at the back for loosening the ground about strawberry or cane plants without danger of cutting roots or plants. Spades for setting and forks for digging plants, and strong hand trowels, filed sharp for layering strawberry plants, are necessities.—Michigan Farmer.

Keeping of Canned Fruit.

Canned fruits keep because the bacteria in them have been killed and others cannot enter if the air is excluded. A few kinds of bacteria can grow without oxygen. If one of these germs is sealed in the can without being destroyed by boiling, the fruit will spoil, even if the jar is air tight. Most kinds of bacteria are destroyed if kept at boiling point for fifteen minutes.

Fruits put up in a large amount of sugar do not have to be sealed, but even preserves are better put in glass jars to protect from mould, which is apt to form on top of a large open dish. Mould grows from spores which are always floating about in the air. When these small particles fall upon a moist surface, which furnishes suitable food, they at once multiply and soon cover the entire surface. Mould does not usually cause fermentation of fruits, but is the cause of decay in ripe fruit.

To kill mould spores fruit must be boiled and then kept in a cool, dry place, well covered.

Money in Apple Growing.

There sure is money in apple growing. Enthusiastic apple growers, among whom might be mentioned A. E. Sherrington, of Bruce Co., Ont., and B. J. Case, of New York State, have testified that they make 17 per cent from their apple orchards valuing them at $1,000 per acre. Many others state they make 10 per cent and better from their orchards, valuing them at $1,000 per acre. Demonstration orchards under government management last year showed that mast remarkable returns may be secured even from old orchards that have sunk practically into decay. Now, Professor Crow, of the Ontario Agricultural College, Guelph, gives figures to show that over 300 per cent returns can be secured from the labor spent in thinning apples while on the tree early in the season. We know that several hundred per cent profits are secured from the investment and labor in connection with spraying apple trees.—Farm and Dairy.

Orchard Cultivation Cover Crops.

We must regulate our methods of orchard cultivation according to the differences in soil and climatic conditions with which we have to contend. Too much general advice as to the mode of procedure in orchard cultivation has been given. And the most of us are all too liable to follow this advice.

No matter what kind of a soil we have, however, we can lay it down as a rule that we should start to cultivate early. When to stop cultivation and put in the cover crop depends on the condition of the subsoil. If the subsoil is too moist, there is more danger from too much cultivation than from too little. In this case put down a cover crop just as soon as you can. A sandy soil with a sandy subsoil requires different treatment than a sandy soil with a moist subsoil. The first should be cultivated later in the season than the second. Every orchard man, however, should watch his trees and decide for himself what treatment the orchard requires.

COVER CROPS.

With most soils a leguminous cover crop in the orchard is desirable, but if the soil is very rich, leguminous crops may be injurious in that they will cause excessive wood growth and deter ripening. Clovers and vetches

I bought a horse with a supposedly incurable ringbone for $30 Cured him with $1.00 worth of MINARD'S LINIMENT and sold him for $85.00. Profit on Liniment $54.00.

Constipation

Is The Cause of More Sickness Than Anything Else.

If You Wish To Be Well You Must Keep The Bowels Open. If You Don't, Constipation Is Sure To Follow.

MILBURN'S LAXA-LIVER PILLS

act on the bowels and promote their free and regular action, thus curing Constipation and all diseases arising from it.

Mr. Harry Revoy, Shanick, Ont., writes:—"Having been troubled for years with constipation and trying many remedies without success, I finally purchased Milburn's Laxa-Liver Pills and found them most beneficial; they are indeed splendid pills and I can heartily recommend them."

Price 25c. per vial or 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

ACADIA UNIVERSITY

Acadia College

Founded 1838. Wolfville, N. S.

A time-honored institution for the education of practical young men, whose graduates achieve real success. Courses in Arts, Engineering and Theology, leading to degrees of B. A., B. Sc. and B. Th.

Where thorough scholarship and high character are co-equally developed. Wholesome moral influences. Unsurpassed location. Fine athletic equipment. Low cost for tuition and board. Faculty of 25 specialists. Last year's enrollment, 230. Fall term begins Oct. 4. Write for catalogue.

GEO. B. CUTTEN, Ph. D., President
Wolfville, N. S.

ACADIA UNIVERSITY

Acadia Seminary

Founded 1878. Wolfville, N. S.

The Pre-Eminent School for Girls and Young Women—in the "Land of Evangeline."

Every modern facility for physical, intellectual and moral culture. Comfortable buildings, with modern equipment. Careful social training. Strong faculty of 22 teachers. Last year's enrollment 303.

Eleven Complete Courses — Collegiate, Junior and Senior University Matriculation, Piano, Voice, Violin, Art, Oratory, Domestic Science, Business and Special Course. Low cost. Fall term begins September 6. Write for catalogue.

REV. H. T. DeWOLFE, D. D., Principal
Wolfville, N. S.

ACADIA UNIVERSITY

Horton Collegiate Academy

Founded 1829 Wolfville, N. S.

Select boarding school for boys, preparing for University Matriculation in the Arts, Sciences and Engineering. Also a thorough Business Course, including Stenography and Typewriting, and a complete Manual Training Course.

The unsurpassed location, high standards of scholarship and conduct, wholesome moral influences, superior athletic equipment, long career and low cost, make this school famous. Enrollment last year 197. Fall term begins Sept. 6. Write for catalogue.

Wolfville, N. S.

Keep Your Animals Thrifty.

A good pasture will keep your animals thrifty but dry feeds lack the aromatic qualities necessary to the thorough assimilation of food. Herbageum will economically replace these aromatic qualities and ensure results almost equal to those of a first class pasture. This preparation is manufactured at Galt, Ont., by the Beaver Manufacturing Co., Limited, and is endorsed by the foremost breeders and feeders of Canada. It has stood the test of trial for nearly twenty-five years and is thoroughly reliable.

Load This Wagon To the Fullest Capacity.

Every dollar invested in a T-K Handy Farm Wagon will be repaid over and over again in saving work loading and unloading, besides this wagon will carry as heavy a load as any pair of horses can draw, without tiring them. It earns money for you and makes farm work easier.

TK Handy Farm Wagons and Wide Tire Steel Wheels

The success of our Wide-Tire Steel Wheels has been unprecedented in the history of wheel manufacture. They solve the problem of getting over the worst roads without lightening the load or tiring the horses. Mud won't clog them, bad roads won't injure them, yet they are cheaper than wooden wheels.

Agents Wanted!

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Steel Ladder.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co., Sussex, N. B.

"I was cured of diarrhoea by one dose of Chamberlain's Colic, Cholera and Diarrhoea Remedy," writes M. E. Gebhardt, Oriole, Pa. There is nothing better. For sale by all dealers.

are the cover crops in universal use.

At the Central Experimental Farm we have had good results from summer tares, sown at the rate of 40 lbs. to the acre. The advantage of tares is that they will grow until the land is frozen in the fall. Most cover crops, if they do not get a good start owing to dry weather, are killed by the first frost and the ground has no adequate covering. Tares even without a good start, will make a good growth in the fall after other crops have been killed.

Lately, also, we have been using rape to mature the wood, as in our cold climate proper ripening is very important. It is sown at the rate of five pounds to the acre, and plowed under in the spring.—W. T. Macoun, Dominion Horticulturist, Ottawa.

A New San Jose Parasite.

The state entomologist of Indiana, B. W. Dougals, believes he has discovered a fungus which will eventually rid the orchards of America of San Jose scale. It was discovered near Seymour, Ind., and does not exist in any other part of the state except where it has been artificially cultivated at the experiment station. It is called the red-headed fungus, and its value lies in the fact that it either eradicates or arrests the work of the San Jose scale. The fungus was discovered about three years ago by Frank W. Wallace, a field deputy of the department of entomology of Indiana. He collected specimens from fruit and shade trees on the farm of J. D. Shepard. About May 1st, Prof. Richards of Purdue university secured some specimens and is making a more complete investigation.

On examining a pear tree which had been seriously affected by San Jose scale, Prof. Richards found a large portion of the scale dead, evidently because of the presence and work of the red-headed fungus. Mr. Douglas, the state entomologist, warns fruit growers, however, that they must not expect too much of this fungus at once.

Investigation so far demonstrates that it can be cultivated and grown in large quantities. If it can be transplanted to different parts of the state the scale problem will be largely solved. Mr. Douglas believes it will result in checking the spread of the trouble and will, consequently, prove of greatest value.

New Assistant Horticulturist at Macdonald.

E. M. Straight, B. S. A., has been appointed assistant in Horticulture at Macdonald College, to fill the position vacated through the resignation of J. F. Monroe, who has gone to South Carolina, being engaged as agricultural agent af the Southern Railway Co., with headquarters at Columbia, S. C.

Mr. Striaght was born at Cambridge, Queen's County, N. B., where his father carried on a truck-gardening business, producing the earliest truck crops supplied to the St. John N. B., market. He taught school for five years in his native county, spending the summer with his father assisting him in his truck-gardening operations.

The call of the farm being too strong, he left teaching, and engaged for a number of years in intensive market-gardening at Cambridge. He was the first in that section to erect a greenhouse for the development of plants for early market crops. This start has resulted in the erection of many similar houses for this purpose by others in this and adjoining sections,

He broke away from the activities of the farm, and took two years at the Nova Scotia Agricultural College, Truro, N. S., securing a diploma from that institution. He followed this with one year at the Ontario Agricultural College and the following year at MacDonald College, graduating from that institution in the spring of 1911.

EVERYONE knows that if soil is not fertilized it will soon wear out. The barren condition of thousands of farms in this country proves this statement. A large percentage of this number could be improved if manure were spread judiciously.

Field experiments prove that eight tons of manure evenly spread are as good as twice that number spread in a haphazard way. Hand spreading requires at least twenty loads to cover an acre. With a manure spreader, eight loads will cover the same amount of ground more evenly, but—

Your problem of soil fertility is only half solved when you decide to get a manure spreader. The other half—of equal importance—is in deciding just which spreader is best for you to buy.

If you investigate thoroughly and decide carefully, you will select a spreader that thousands of other progressive farmers are having great success with—one of the

I H C Manure Spreaders

The simple design and unusual strength of all working parts of I H C Spreaders account for their long life and light draft.

The method of transmitting power from the wheels to the beater is simple and direct. There are no unnecessary parts to wear. The beater is large in diameter and the teeth are long, square, and chisel pointed. By using this style of tooth, the manure is thoroughly pulverized and is thrown out before it wedges against the bars. By using a square tooth, rimming of the bars is overcome.

I H C Service Bureau

The Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problem to the I H C Service Bureau.

The apron is supported by steel rollers and the slats are placed close together, so that manure does not sift down and interfere with the movement of the rollers. The steel wheels have ample strength to carry many times the weight they will ever be called upon to bear. The rims are flanged inwardly to prevent cutting and rutting of meadows and accumulation of trash. Z-shaped lugs give the wheel a practically continuous ground-bearing surface and do not jar the machine to pieces. There is no reach to prevent short turning.

In the I H C line, you have choice of these two famous styles—

Cloverleaf Corn King

All are simple, strong, and durable—all are easily and instantly adjustable to spread light or heavy, as the soil requires, and all three are made in sizes suitable to any size farm. See the I H C local agent—and get catalogues from him, or, write nearest branch house.

DAIRYING.

Handling the Cream.

One of the usual causes for a poor grade of cream is negligence in washing the separator. Too many producers wash their machines but once a day, and some but once in two days; the result is, especially during hot weather, a poor grade of cream. The bowl as well as all tinware should be washed every time it is used, and once a a day preferably in water containing a little sal soda or washing powder. Soap should never be used in washing milk utensils because it will taint the milk. If possible the bowl and all tinware should be scaled in hot water at least once a day and immediately put in the sun, or on a stove to dry. This prevents rusting. Rusting renders the bowl and milk utensils much more difficult to wash and keep clean. The bowl if washed after each using will cleanse easily, in less time, skim more thoroughly, give a more uniform cream and last longer. To operate a separator successfully, the following points should be carefully observed:

1. Clean all parts thoroughly before setting it up.
2. Fasten the frame to a solid foundation, preferably planks embedded in concrete.
3. Set the frame level and keep it level.
4. Oil all gearings and spindle every time before starting.
5. Flush all gearing and bearings with kerosene one or twice a month; then oil well. If this is practiced, the machine will run more easily and the gearing last longer.
6. Prevent dust and grit from entering the bearings of the machine.
7. Run the machine at the proper speed, usually marked on handles.
8. Use a watch in timing speed. Do not guess it.
9. Do not start the milk through the bowl until the required speed has been reached.
18. Warm the bowl and fill with hot water before starting during cold weather, especially if the machine is kept in a cool place. It may prevent the cream from sticking in the bowl.
11. Flush the bowl with warm water or warm skim milk.
12. Wash the bowl immediately after it has been used.
13. Dry the parts of the bowl when washed by placing on a fairly warm stove, or if possible hang in the sun all day. Keeping them dry prevents from rusting and the sun acts as a germicide.
14. Be sure to keep the skim milk outlets open; if they are not properly cleaned the test will go down.
15. Set the cream screw so that it will deliver from 28 to 35 per cent. cream during the winter and from 33 to 45 per cent during summer; or if a 3.8 per cent milk is skimmed, have the machine deliver eleven to fourteen pounds of cream per 100 pounds of milk during winter and from 8.5 to 10.5 pounds of cream during summer.
16. Sepaeating milk in an unwashed bowl that has been standing for several hours is a "fi,thy practice."

Poor and off-flavored cream more often results from improper care than from any other cause. It is true that the most common fermentation in milk and cream is due to the development of lactic acid bacteria, or souring, which in the case of cream or tions prevailing on most farms at present, a special effort must be made to check the development of these bacteria, or a poor, off-flavored grade of cream will be the result. This is most economically done by means of cold water which usually must be pumped in abundance for the stock. Why not utilize the cold obtainable in that way and produce a better grade of cream?

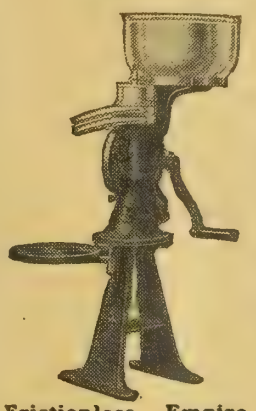
When one is through separating the vessel containing the cream should be placed at once in cold water. Common milk cans, or other well tinned metal vessel, free from rust, are better containers for cooling cream than crocks or jars because metal vessels are better conductors of heat and cold. Consequently the cream can be cooled more quickly in them. It is desirable to stir the cream once or twice while cooling, because stirring hastens the cooling, increases the keeping qualities, and results in a smoother and more uniform cream. Never allow the cream to run directly from separator into the can containing previous skimming, nor permit it to stand beside the separator so long as half an hour before cooling; either is sure to result in poor quality. If the cream is left at animal temperature, especially in warm and sultry days, there may develop in an hour millions of bacteria, which will cause a rapid deterioration in quality of the cream. Therefore cool at once. Each separating should be cooled before being mixed with the previous skimming and whenever two or more batches of cream are poured together the whole lot should be thoroughly stirred.

Unless well lighted and well ventilated, the cellar should never be used as a place in which to keep cream. Of necessity vegetables, fruits, meats and other strong odored household provisions, must be kept in the cellar, and from these the cream very readily absorbs odors. Setting warm cream in the cellar does not cool it nearly as quick,y nor too as low temperature as when placed in cool water, and consequetly the cream does not keep so well. Many cellars have a dirt or clay floor, and many, particularly in older houses are very poorly ventilated. Keeping the cream in such places gives it a very objectionable musty flavor that cannot be eliminated in churning. Hence, do not keep the cream in the cellar.

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learned that in the



Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Minard's Liniment Co., Limited

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H 309, Windsor, Ont.

butter making is not very objectionable, if it is not carried too far. Since it is almost impossible to obtain milk or cream free from dirt which carries undesirable bacteria, especially as produced under conditions in reality the case. We aave recently been making some tests with a closed pail. One-half of the herd was milked in the open pail and the other half in the closed pail. The milk was shipped in separate cans and the number of bacteria determined on arrival at the milk plant. This was continued for several milkings, and the average of all counts showed a reuction in the number of bacteria of over 80 per cent by using the covered pail.

"More important still is the immediate cooling of the milk to 50 degrees, or lower if possible. Bacteria grow very rapidly in warm milk, and a few in milk when it leaves the stable, become thousands before reaching the city. A little more care in milking and cooling the milk will not only save money by avoiding loss through sour milk but will help protect the health of the people of Indianapolis.

"As an instrument in spreading diseases, milk is an occasional offender. Epidemics of typhoid fever, scarlet fever and diphtheria have been traced to the milk supply. Persons not suffering from these diseases may carry the germs. Flies are a recognized source of infection. It is impossible to prevent occasional contamination of milk by disease germs. It is now a quite generally accepted fact that tuberculosis is transmissible to man by means of infected milk. In view of these facts the only safe method of guarding against the spread of disease by milk is pasteurizatian and the immediate placing of the pasteurized product in sterilized bottles.

"Pasteurization also destroys about 98 per cent of all other bacteria, and some of these do greater harm than those which cause specific diseases. Bacteria, harmless in themselves, by decomposing or splitting up substances on which they grow, may produce poisons or substances having a harmful effect. Thus, bacteria in milk may, by growing in milk, or in the intestines after being taken into the system, cause putrefaction or abnormal fermentations resulting in sickness, and in the case of infants, frequently in death.

"The greater portion of these bacteria come from manure and the dust of the stable and get into the milk during the process of milking and straining the milk. Dust and hairs fell from the udder and flanks of the cow into the pail, and bacteria from the air are carried into the pail by the streams of milk. Flies in the milk or on the strainer leave many bacteria which had been adhering to their legs and bodies."

Ripening Cream on the Farm.

There is perhaps no other factor in farm buttermaking that causes more trouble than the lack of proper ripening or souring of the cream. On many farms the ripening is done with no other purpose in view than that of causing the cream to churn more easily.

The object io ripening cream should be to cause the cream to churn more readily, and to produce desirable flavor and aroma. That cream will churn more readily when sour is a fact well known to any one who has had experience in making butter. However, when it comes to the production of good flavor and aroma in the butter, may fail to grasp the principle underlying the production of these good qualities. The main reason why butter fat commands a higher price on the market than other fats is that it has a peculiarly desirable flavor and aroma which cannot be exactly reproduced in other fats. For this reason it is desirable and profitable to develop these qualities in butter to the highest possible degree.

In order to prouce desirable flavor it is very essential that the milk and cream be handled under sanitary conditions.

To introduce filth into the cream is to introduce not only the bad flavors which that filth contains, but also germs which will tend to develop some kind of a bad flavor in the cream.

The germs or ferments which produce a clean sour taste in the cream are the ones that will produce a good flavor in the butter. The addition of a small amount of clean tasting sour skim milk or buttermilk to the cream about six or eight hours before churning will introduce desirable germs which will sour the cream and at the same time produce desirable flavors in the butter.—G. E. Frevert, Assistant Dairyman, University Experiment Station.

WINDSOR DAIRY SALT

"Expect to get the prize for the best butter, this year?"

"Of course I do.

I have the best cows in the country—and here's my Windsor Butter Salt.

You can't beat that combination.

You know, I have won first prize for the best butter ever since I began to use Windsor Butter Salt"

"Hope you win"

"Thank you, so do I" 41

BEST RECORD

Ever Made

By Any Cream Separator.

Only a

SHARPLES

Could Do It

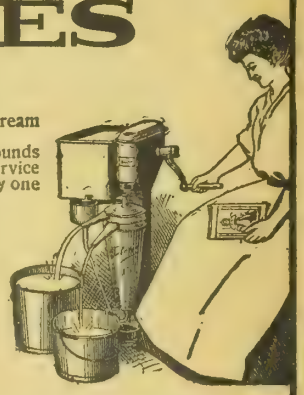
We have repeatedly told you that Sharples Dairy Tubular Cream Separators wear a lifetime.

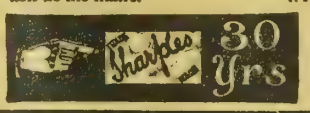
One of our regular hand-driven Dairy Tubulars, of 500 pounds capacity per hour, recently finished work equal to 100 years' service in a five to eight cow dairy. Total cost for oil and repairs only one dollar and fifteen cents.

Ask us to mail you the fully illustrated record of this great demonstration of Tubular superiority. See how the parts of this Tubular resisted wear. Tubulars are guaranteed forever by the oldest separator concern on this continent.

Tubulars outskim as well as outwear all others. Have twice the skimming force. Skim faster. Skim twice as clean. Dairy Tubulars contain no disks.

You will finally have a Tubular. Get the Tubular first. You can see the Tubular for the asking. Our local representative will gladly show you the Tubular. If you do not know him, ask us his name. Write for catalog No. 194.





THE SHARPLES SEPARATOR CO.,

Toronto, Ont., Winnipeg, Man.

LIVE STOCK

English Wools and British Sheep.

I am glad to hear that at last interest is being taken by Canadian agriculturists in the question of sheep-breeding and wool-growing, for I have long said that farmers in our Western Dominion were not living up to their privileges, and were not supplying the world with its full share of raw material. As one surveys the map, and observes the various natural conditions of the country, there is only one conclusion that can be arrived at, namely, that Canada owns millions of acres upon which sheep can be run, and kept to profit. Although these last few years our supply of raw material from Australia, New Zealand and South Africa has sensibly increased, still no surpluses of wool are being grown anywhere; in fact, the wants of the world have these last ten years increased so quickly that supplies have not been able to keep pace with the demands of the manufacturers. This is evidenced to-day by the good prices which are being paid wool-growers in every quarter of the globe with the exception of the United States, and I am certain that there is room in Canada for carrying at least 55 million sheep; and if flocks are founded on good mutton and wool foundation, they will pay the owners. However, that side of the question can be left to the live stock authorities of the government. Suffice to say that the manufacturers of Great Britain are quite prepared to give a fair market price for any wool grown in Canada, providing it is sent to market in a proper, business-like way.

It has been my privilege to see consignments of Canadian wool sold during the past two years at the London sales, but there is yet much to do before the Canadian staple is presented to buyers in the attractive manner which good business methods demand. The wool is right enough, but when fleeces are tied with string about the thickness of a cart rope, it shows distinctly that growers have little knowledge of the requirements of the trade. String, binder twine, and bands of every description want keeping as far away from wool as possible, and, in the tying up of fleeces a "neck-band" can be made out of the fleece, that being all the trade requires. However, this will come with the spread of knowledge, it being our object today to say a few things on the various names which are given to different classes of sheep, as well as wool. These vary in different countries, but, briefly stated, they are as follows:

AUSTRALIAN DESCRIPTION OF NAMES APPLIED TO SHEEP.

Pure-bred—This name is given to any acknowledged breed or type of sheep free from any admixture of any outside strain. There are pure-bred animals of a large number of breeds, such as the Lincoln, Leicester, Southdown, Shropshire, Hampshire, Kent or Romney Marsh, Cheviot, Blackfaced, etc.

Half-bred.—This is the progeny resulting from a cross of two pure breeds. A very common thing in the North of England and the South of Scotland is for the pure Scotch black-faced ewe to be crossed with a Wensleydale or a Leicester tup, the lambs being called half-breeds.

Cross-breds. This really is a term applied to sheep bred in New Zealand and South America, and is the sheep produced for the frozen-meat trade. A cross-bred simply means a sheep that has been obtained through crossing two or three times with mutton breeds. These, are very useful, and produce a good carcass, as well as a useful style of fleece.

Ram.—A male sheep of any breed, and kept for stud purposes.

Ram Lamb.—A young, unweaned male sheep. A ram lamb is seldom used for stock-breeding purposes, the custom being to wait until the sheep is two years old. Using young ram lambs for service is not advisable.

Stag.—This applies to a matured, castrated lamb, known in Australia as a weder or wether, but few sheep of this class are kept.

Rigg—A young male sheep that has not been properly or only half castrated. This term is fast dying, and is of little consequence.

Wether.—A castrated male sheep, and is applicable to all breeds.

Wether Hogget.—Castrated male sheep, and is so named so long as the animal shows two center broad teeth.

Sheared Hogget—A young sheep that shows two center broad teeth, and which was shorn as a lamb. This term relates either to a male or a female.

Ewe—A female sheep. This term is a very common one, and relates to the ordinary, everyday female sheep kept by all farmers.

Stud Ewe—A purebred female sheep kept exclusively for breeding stud stock.

Flock Ewe—A female sheep of the ordinary or common class, running all together, without any special attention being given to them.

Wet Ewe.—This name signifies a female sheep suckling its lamb.

Girt Ewe.—This signifies a pregnant ewe.

Dry Ewe—A ewe missed by the ram, and not in lamb.

Maiden Ewe.—A young ewe not put to a ram, usually under eighteen months old.

Ewe Lamb.—A baby female sheep, so termed to the time of being weaned.

Poddy—A lamb having lost its mother, and oftentimes stunted in growth.

Comeback—This really applies to a cross-bred ewe which is mated with a pure-bred ram, and so bred back to its original state of purity. It means "coming back" to the pure breed.

ENGLISH AND SCOTCH EAMES.

Ram or Tup...A male sheep.

Hog, Hogget, Hoggrel. — These names are given sheep in different localities, and mean the time of weaning to the first shearing.

Shearling.—Dinmont tup, or one-shear tup, covering the period of the first shearing to the second.

Two-shear Rams—From the second to the third shearing.

Three-shear Rams.—From the third to the fourth shearing.

Four-shear Ram.—From the fourth to the fifth shearing. It is not often that rams are used after the fifth year.

Wether Hog or Hog Wether.—This means a sheep after the first shearing to the second shearing.

Wether Teg.—Used mostly in connection with Down breeds, and is a castrated male sheep up to the first shearing. The word "teg" is used in connection with no breed that I know of, excepting in connection with Downs.

Ewe.—A female sheep.

Ewe Teg.—A female sheep up to first shearing.

Gimmer.—A Scotch name given to a female sheep after the first shearing. This is a very familiar term in the north of England and throughout Scotland.

Barren Gimmer.—A ewe sheep not capable of bearing a lamb.

Eild Gimmer.—A female sheep not put to a ram.

Yeld Ewe.—This is a name given to a ewe that has been put to the ram, but not in lamb.

Draft Ewe.—An ordinary flock ewe of any age, but one which has reached an age when it should move off and be fattened for the butcher.

Cross-bred.—The progeny is the result of crossing different breeds of sheep. See previous note.

Half-bred.—See previous note.

Anyone digesting the above terms will gain an intelligent grasp of the real meaning of sheep terms, these being used almost daily with sheep farmers throughout Great Britain and the Colonies.

TECHINICAL TERMS USED IN THE WOOL TRADE.

This really deserves a chapter to itself, but a brief summary may be attempted. At the same time, they are not of serious importance to sheep farmers, though I have always believed in the wool-grower being as familiar with the technical terms of the wool trade as spinners and the manufacturers. Still the first thing

Feel Young for Ever.

Let Me Put Vitality Into Your Blood, Nerves and Body. Follow Me to Health and Manhood. I Can Show You What Others Have Done to Change Debility, Weakness and Despondency Into Health, Strength, Vigor.

Vitality is the measure of the man in this day of big deeds and monster achievement. He who has great vital strength cannot grow old. Years count for nothing if you have the vitality in your blood and nerves. My Health Belt with suspensory attachment is the FOUNTAIN OF PERPETUAL YOUTH; It pours quantities of electro-vital force into your weakened system. It works quietly, mildly, continually hour after hour while you are sleeping. It is your opportunity as it has been the opportunity of tens of thousands before you; it supplies you with that vitality upon which health and courage depend. It is a power and strength giver of the highest order. No drugs, nothing to take internally, no dieting, no hardships of any kind. Simply use the Health Belt nights until you are restored to vigor. It never ceases until you have as much courage and self-reliance as the biggest, fullest blooded man you know. Your eyes will have the sparkle of full health, you will have the vigor of a strong, healthy man. Henry Eggman, Norwich, Ont., writes: "Thanks to the use of your Health Belt I am young again. It restored me after all else failed. Use my testimonial as you see fit." This is but one of thousands. Get the free books and read of others.

Special rheumatism attachments to my Health Belt carry the Electro-Vitality to any part of the body, neck, back, arms, legs, feet. It finds and drives away all pains and aches; it has often completely cured weak back in one night so that it never returned again. It is a wonder remedy for chronic ailments of the nerves, blood and muscles.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Be on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

These Books Sent Free

Let me send you these books, They contain much valuable Health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a post card, or if possible call at office and see Belt, Office hours: 9 to 6, Saturday until 9 p. m.

for Canadian growers to do is to produce an acceptable fleece, and then to prepare that for market in a common sense and business-like way. There is ample room for a chapter on the preparation of wools for market. Suffice to say that every shorn fleece should have the heavy britch removed, to which is usually attached tags or what are sometimes called clags or muck lumps. All heavy, objectionable matter of this kind needs removing before the fleece is rolled, and if the bellies are also full of dirt and filth, it is as well to remove these, bale by themselves, and sell separately. This means that if the fleeces have been well skirted, buyers purchase them with confidence, for the reader can easily see that, when there is a heavy britch attached to the lightest part of the fleece, they always depreciate the latter considerably.

We do not find the technical terms so frequently used outside the wool warehouses as was the case twenty-five years ago, but, for all that, they still exist, and they are as follows:

Super.—This is the very finest part of the fleece, and usually the pick of the shoulder. It can be taken for granted that if the shoulder wool is deficient, all the remainder of the fleece is wanting also.

Fine.—The best part of the fleece next to the shoulder. In an extra-fine demi-lustre fleece the quality will run up to 56's.

Blue.—The shoulder of an average lustre fleece, say, Lincoln or Leicester, which will range from 36's to 44's quality.

Neat.—The sides of an average lustre fleece of 32's to 36's quality, according to the style and breed of the wool.

Brown.—Mostly from the flank, going between the neat and the britch, say 28's to 30's quality, according to the style of the wool.

Breech or Britch—This is wool off the thigh. In a good fleece, the britch or the lowest part will range about 28's quality.

Cow Tail.—This really is a term implying a very coarse wool. It is rough, strong, and often wiry, and ranges from 20's to 24's quality.

The above terms really relate to lustre and demi-lustre wools, and comprise such breeds as the Lincoln, Leicester, Kent or Romney Marsh, Irish and Yorkshire.

The following are the terms perhaps most in use among sorters, and convey to the reader a more intelligent idea of the technical terms used in the English wool trade.

Picklock.—As the name implies, it is the choicest part of the fleece.

Prime.—This is very similar to the previous description, though a little stronger in quality.

Super.—Wool coming from the shoulders.

Seconds.—The best bits from the breast.

Downrights—The strong wool coming from the sides of the sheep.

Breech.—The wool coming from the haunches of the sheep.

The technical terms of the Australian wool trade; which comprise mostly Merinos, are as follows:

Combing.—The longest and best part of the fleece.

Clothing—Good wool, but usually shorter in staple than the combing.

Broken.—This is wool from fleeces that usually get broken in shearing, owing to the fleece not being so well grown.

Necks.—Wool taken from the neck of the sheep, classed as such, and sold in the same way.

Pieces.—These are the skirted portions of the fleeces, and are usually worth 2 to 6 cents per pound less than the combing. On large stations usually three classes are made, namely, 1st, 2nd, and stained pieces, the latter oftentimes being urine stained.

Bellies.—The wool from the under part of the sheep, which is heavy and dirty.

Locks.—This is the heaviest portion of the fleece, comprising oftentimes the small bits that drop from under the classing or sorting board.

My own view is that Canadian sheep farmers need not trouble about the technical terms of the wool trade, although it is as well to know them.

What users want are good, useful fleeces, and anything I can do in the way of furnishing information will be readily done. There is no doubt that English breeds of sheep are the bested suited for Canada, and nobody need be afraid of producing a surfeit of raw material. Climate and pasturage will largely determine the class of sheep to be kept, and I am certain that Canadian farmers can breed and keep sheep to a profit.

By S. B. Hollings, editor of The Wool Record, Bradford, England.

Mr. W. S. Gunsalus, a farmer living near Fleming, Pa., says he has used Chamberlain's Colic, Cholera and Diarrhoea Remedy in his family for fourteen years, and that he has found it to be an excellent remedy, and takes pleasure in recommending it. For sale by all dealers.

Back Your Cows With An IHC Cream Harvester

For Greater Profits

If you are not backing your cows to the fullest extent, you are not cashing in all the profit they are producing. You need a *good* cream separator to get the full value out of the milk.

But in buying, remember that 80 per cent of cream separator troubles are caused by milk and dirt getting into the gears—and that I H C Cream Harvesters, Dairymaid and Bluebell, are the only separators with milk and dust proof gears that are easily accessible. Also remember that while any separator may skim close for a month or two, none of them can keep up with the I H C year after year.

If you investigate further, you will find that Dairymaid and Bluebell Cream Harvesters are equipped with a patented dirt-arrester which removes the finest particles of dirt from the milk before it is separated. You will find that the frame of an I H C Cream Harvester is entirely protected from wear by phosphor bronze bushings; that the I H C has large shafts, bushings, and bearings.

The Right Style and Size

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes from 350 to 850 pounds capacity. Let the I H C local agent tell you all the facts, or, if you prefer, write nearest branch house for catalogues and any special information you desire.

CANADIAN BRANCHES—International Harvester Company of America at Brandon, Calgary, Edmonton, Hamilton, Lethbridge, London, Montreal, North Battleford, Ottawa, Regina, Saskatoon, St. John, Weyburn, Winnipeg, Yorkton.

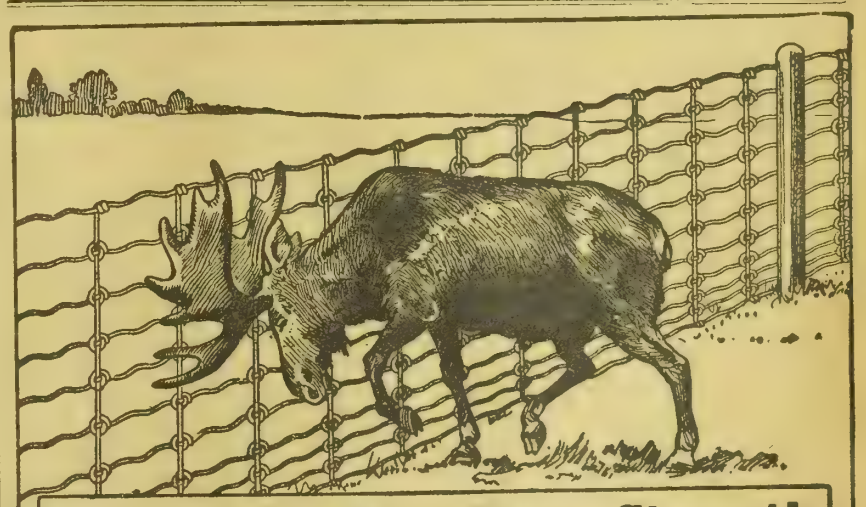
I H C Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.



This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • • 11

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

NEW BRUNSWICK WIRE FENCE CO., Ltd., Moncton, N.B.

MARITIME WIRE FENCE

THE HORSE.

Most Valuable Horse on Earth.

The most valuable horse on the farm is not always the one that will sell for the highest price. Money consideration is the usual standard by which values of animals are measured, but there are qualities of training, of service, of skill in performing work that the horse acquires, in his years of service, that in a sense make him an expert, and adept in certain lines of service; thus the old horse frequently is worth more on the farm than the stylish, high strung, young horse that would readily command two or three times more money in his sale than the old, steady farm animal.

Most farms, especially where there is a level-headed, rather old man, or at least middle-aged man, in management, has one or more old reliable horses that money cannot buy. These are the horses, generally two, that made up the team for the boys to work in their beginning days in learning to handle the farm work. This team of old standbys knows all the ins and outs of all kinds of work on the farm, and all the boy has to do is to hold on to the plow or keep the lines from getting tangled up, and they will do the rest. They could go to town safely by themselves, if turned loose and started and go right up to their hitching post, or they could come home without an accident or driver. They are never looking for an excuse to get scared at something, or to feel a trace loose or something not just right, about the harness. This old team probably has been on this same farm from the time they were shy, skittish young horses, and they have learned all that is to be known in good behaviour and doing things right; they have passed the age of foolishness.

What is such a team worth to the farm? Nearly every well managed farm has one or two such horses, generally two, a team of such horses, who are any place from 10 to 15 years old.

"I never keep a horse after he is 8 years old," says the conceited young farmer, "let the other fellow keep the old horses. I want teams that are always growing into money. Something that will sell every day in the year."

This sounds good, all right, from a horse dealer and horse fancier point, but for the farmer who wants service, who wants work, with the least possible per cent of breakage of implements and consequent expense due to the fractious young horses, and ill-tempered drivers, there is a sentimentality in favor of the old farm horse, the one old horse or one team of old horses, that cannot be discounted by any amount of horse pride and ownership of fine appearing teams.

In no feature of the team work does the fine, big, stylish, well mated team show off to better advantage than in the farm wagon, on the road or on the street of the country town. These and a pleasure to own, and handle, active, young horses are a necessity but do not forget the old family horse that is used so much in everything about the farm, yet so little that he is not credited with what he does, and never missed until he is sold. He is like the errand boy on the farm. He is never credited with one-fourth the work he does. How easy it is for the hired man to call:

"Johnnie, you run over there where I was plowing yesterday and get me that monkey-wrench."

It is possibly only across a half section or a little half mile or quarter mile run, and Johnnie needs the exercise. Johnnie is scarcely back until there is another call to take the cows out to pasture or to go over to John Smith's and borrow their post auger. Thus Johnnie is kept on the go from morning to night, or when there is school every vacant hour he has outside the school house he is waiting on somebody. He scarcely gets time to play ball or engage in any of the child amusements usual to the boy. Yet "he does not do anything." He is just like the old farm horse knocking around, doing a little of anything, a little of everything, that a team is not called upon to do, but if you follow the old horse or the boy all day, you will find it one of the hardest day's work you have done for a long time.

On some farms, this old horse is appreciated. On every farm where there is a thoughtful, considerate, kind hearted manager of the farm affairs, this old horse has a value that puts him entirely out of market.

Horse Colic.

This is apt to occur when you begin feeding new grain, new hay, or any sudden change of feed in which the horse is apt to eat too much at one time, as when he gets loose and and gets into the oat bin.

Horses that get a little pasture nights and Sundays, or horses that are fed sheaf grain will not be bothered with colic.

The stomach of a horse is very small. If the teeth are in poor condition so that he can't grind his feed, he bolts it down without chewing, and it swells and causes pain. The teeth need looking after.

In case a horse has the bolting habit and nothing is wrong with the teeth, then put some good-sized smooth stones in the feed box, or nail some strips across the bottom so that the horse has to work slow to get a feed.

Colic sometimes follows a large feed that is washed down with a big drink. Water partly before feeding and finish up after feeding, before going to work; this prevents washing the grain into the intestines undigested.

Some horses would eat hay all night if they had it. That keeps the stomach everlastingly at work and it soon loses its tone. The stomach needs rest just as much as the horse does, and the horse should not be fed more hay than it can eat in an hour or two. A stomach in good condition, good tone, can digest a meal quickly and thus prevent fermentation and colic.

Different things may cause colic. Whatever the cause, prevent the horse from falling, or rolling, or doing itself injury because of the intense pain. There's danger of rupturing the stomach when full of swelled grain—then the horse soon dies. Half-ounce doses of extract cannabis indicate every hour or two will quiet the animal.

A quart of raw linseed oil and two ounces of turpentine will give relief and start the bowels. Injections of cold water or warm soapsuds helps.

Give no feed for several hours, and rest him for a day or two.

Prevention is better than cure, so be cautious about feeding, examine the teeth if colic is common, and have turpentine and raw linseed oil handy all the time—this is good for bloat in all animals.—Successful Farming.

Horsemen Attention!

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as, Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING.

CURES:

AFTER USING.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended, Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on its merits, you will be compelled to endorse it.

TESTIMONIALS:

DEAR SIR:—I had a mare which had a very bad cough and heaves for almost six months, and became so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR:—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contraction of the hoof.

W. A. C. RANDALL, M. D.

MESSRS. FRASIER, THORNTON & CO., Cookshire, Que.

GENTLEMEN:—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable.

(Signed) WALTER SLATER, "Cash Livery."

FRASIER, THORNTON & CO., Cookshire, Que.

DEAR SIRS:—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market, and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
March 28th, 1911. Hawkshaw, N. B.

POULTRY.

Feeding for Bright Colored Yolks.

In the development of the poultry business, scientific feeding has been one of the important factors, not only in increasing the total production, but in raising the standard of quality of the egg itself as a food product.

Feeding may affect the quality of the egg in two ways; as to flavor, and as to color of the yolk.

As regards flavor, there is a wide difference in eggs. While no single breed furnishes eggs of any certain flavor, the eggs of different breeds under the same conditions being exactly similar, yet the difference between the eggs of two flocks of the same breed, kept under different conditions, may be very marked. Eggs from fowls fed on clean, wholesome food are always superior in flavor to those fed on inferior or tainted food of any kind. Tainted meat, musty grain and rancid food of any kind impart a disagreeable flavor to eggs that detracts much from their market value, if it does not render them entirely useless.

As to color in the egg, the general public is to a large extent in error as to the relation of color in an egg to its nutritive qualities. Most people believe that an egg with a deep yellow yolk is more nutritious than one with a pale yellow. It is also the general opinion in some communities that an egg with a dark shell is more nutritious than one with a white shell. Careful analyses, however, have failed to uphold these beliefs, which are not really based on any well defined theory. The analyses show that there is not very much variation in the nutritive value of eggs and that what variation there is has no connection with the color of the yolk or shell. These variations will occur as often between eggs of the same color as between others.

However, because of the fact that this idea of the effect of color upon the food value of the egg is so general, the matter has become of commercial importance, as all of the fancy trade demands an egg with a yolk of a rich orange color.

Six

minutes is all the time required for brewing Red Rose Tea; and the result is a beverage of matchless flavor and satisfying strength. The verdict of your family will be that

96

RED ROSE TEA "is good tea"

Drinking Fountains.

One of the difficult problems for the poultrymen to solve is how to easily provide pure, fresh water for his fowls, says Journal of Agriculture. Many patent fountains which are on the market are automatic and keep before the fowls a certain quantity. Under certain conditions, these fountains serve an admirable purpose. Under more adverse conditions many of these patent contrivances fail to give satisfaction, for the simple reason that it is impossible to keep them clean.

If fowl were fed only whole grain and the weather was always cool, it would be a comparatively easy matter to provide satisfactory automatic drinking fountains, but as soft food forms a considerable portion of the diet for laying hens and fattening fowls, these fountains are necessarily more or less fouled and in warm weather soon become unfit for use as drinking fountains on account of the tainted water and disagreeable odor.

A simple, wholesome arrangement may be made as follows: Place an ordinary milk pan on a block or shallow box, the top of which shall be four or five inches from the floor. The water or milk to be drunk by the fowl is to be placed in this pan.

Over the pan is placed a board cover supported on pieces of lath about eight inches long, nailed to the cover so that they are about two inches apart, the lower ends resting upon the box which forms the support of the pan.

In order to drink from the pan, it will be necessary for the fowls to insert their heads between these strips of lath. The cover over the pan and the strips of lath at the sides prevent the fowl from fouling the water in any manner, except in the act of drinking.

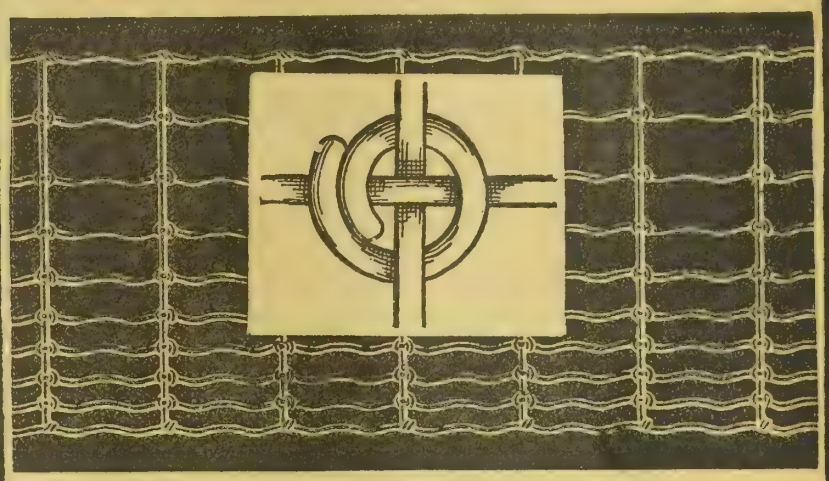
Where drinking pans of this kind are used, it is very easy to cleanse and scald them with hot water as occasion demands.

This arrangement can be carried a little further by placing a pan, or what would be still better, a long, narrow dish, something like a tin bread tray, on a low shelf a few inches from the floor, and hingeing the cover to one side of the poultry house so that it can be tipped up in front for the removal of the dish or for filling it with water. Whatever device is used, it must be easily cleaned and of free access to the fowls at all times.

Royal Brand Farm Fencing

DIRECT FROM FACTORY TO FARMER

FREIGHT PREPAID TO YOUR NEAREST R. R. STATION



ROYAL FENCE is made of the best all No. 9 hard steel wire, heavily galvanized and perfectly woven. The farmers of Ontario have purchased over 200 carloads of Royal Fence this season. Your money back and we pay freight both ways if not satisfied.

Hens Physical Condition.

With certain breeds the tendency is to convert food into flesh; with others into eggs. Therefore, in feeding for eggs these pecularities must be watched. It will not, however, do to apply this rule too literally, because even in the same breed some individual hens show the tendency to lay on more fat than others fed in the same way. On this account, hens that show a tendency to become fat should be removed from the others and fed differently; whereas those that remain in good laying condition may be fed as before.

It is much easier to maintain egg laying than it is to start it again after it has once stopped. For this reason the hens should be handled occasionally to determine what conditions they are in. Those that need special treatment should be removed at once. It is impossible, as a rule, to determine which hens should be removed merely by looking at them. A good time to make this examination is while the hens are feeding. They can be approached and quietly lifted without much disturbance. At any rate, there should never be any excitement about this matter. By placing the hand under the breast the weight of the fowl can be determined and the condition of the flesh felt by the finger and thumb. Failing to reach the hens while feeding, they should be handled at night after they have gone to roost.

Love's Barrier

(Continued from last issue.)

CLEARING THE PATH.

CHAPTER VIII.

They were sorely perplexed at the Girls' Club over the non-appearance of Miss Jane. Lydia Rash, who by virtue of her supposed experience of girls filled the post of secretary and treasurer, went to the door for the sixth time, and peered into the wet darkness of the street. The lights twinkled there, and the echo of a song floated through the half-open door of "The Rose and Crown"; but no Miss Jane. Presently the rumble of wheels and the flash of lights on the summit of the slope proclaimed the rapid approach of a carriage. Lydia was all of a flutter. There was nothing very alarming about Miss Hayes, of High Ridges, who had promised to honor the birthday of the club that evening, but Lydia had no initiative. She tore back into the room where the girls were standing aimlessly about, some of them gathered near the fireplace, giggling consciously over the unusual happenings of the evening. Generally the discipline maintained by Miss Jane was fairly strict. It amused them very much to be left to the tender mercies of Lydia Rash, who was only one of themselves and incapable of inspiring awe. She was just at the club as in her dressmaking business; a methodless creature generally on the outlook for something that did not fit or that had gone astray. She had a scared look on her face, as she rushed in from the open door. "Mercy me, girls, theer's Miss Audrey coomin', an' nobbut t'ask 'er in. Here yo, Bertha Skellet, run up to the Rectory as fast as tha legs can carry thee, an' see wha has happened to Miss Jane."

Bertha, a thin rag of a girl in a tight pigtail tied with an enormous bow of pink ribbon, darted forward, full of importance, and in the doorway fell against the slim, slender figure of Miss Audrey in a long dove-colored cloak with something soft and fluffy and white over her head, The sweetest face in the world, all tenderness and rose-leaf bloom, looked out from that becoming frame.

Lydia came forward bowing awkwardly.

"Miss Jane beant coom yet, Miss Audrey. A've just sent Bertha Skellet to ask what's coom over her Shoo's always here fust. A'a can't mekk it oot."

"Probably the Rector detained her. He came back this evening. My father saw him at the station. Well, and how are all the pigtails?"

She smiled and nodded to them, and they smiled delightedly back, finding her youth and her affability infectious. It was a memory of pigtails Audrey had carried away with her from a previous visit to the club—small, tight pigtails tied with enormous bows. One or two of the bigger girls lately promoted to service had discarded the bows, most unwillingly it must be told, and had their hair screwed in hard knots behind in approved Midcar fashion. They looked like shorn sheep among camfortable woolly lambs.

Audrey's eyes danced sympathy and interest as she spoke to them by name. Young herself, she had warm sympathy for them all, and covered their awkwardness by her smiling ways. Their eyes were big with admiration of her pretty frock. Audrey had honored the birthday by wearing one of the prettiest, what her dressmaker called a "simple little frock." It was made of white silk with a transparent yoke of lace at the throat, and it instantly filled fourteen pairs of eyes with breathless admiration, and one with hopeless envy. The cut depressed Lydia Rash the mysterious cachet she had never achieved, and, alas! never would. All simplicity, it was arranged with an art which gave grace and beauty to the simple straight lines. Lydia could not repress a sigh. She, too, loved beauty and would have loved to handle such gracious and yielding stuffs, to get away from the harh lines of bombazine and homespun.

"Perhaps, dear Miss Jane is not very well," said Audrey blithesomely. "Well, we must do something. What shall it be? Oh, Miss Rash, do let us have a game at hunt the slipper. Who has a slipper?"

Nobody had. Fourteen pairs of bashful eyes went hown to fourteen pairs of strong, serviceable Midcar boots, more or less worn. Lydia Rash involuntarily dropped her skirt in front to hide the old pair she had considered good enough for a dark and muddy night.

Audrey thrust forth an inconceivably dainty foot in a brown shoe set all over with beads, which caught the flash of the hanging lamp in every facet.

"No, no, Miss Audrey!" cried Lydia as she bent breathless to undo the buttons. "Don't you see the floor is bare, and muddy at that. You can't go on your stocking foot."

"No? Then I'll take off my stocking," she said saucily, and did forthwith, whereat the girls gave a shout of laughter, crowding about her, all their shyness disappearing like mist before the morning sun.

She was young too, and frolic was in her blood. She held out the shoe, hung up her stocking over a chair back, and professed herself ready for the game. The toes peeping out from under the white skirt were alluringly pink. A slow smile gathered on Lydia Rash's serious lips. As she confided to Ann Coyne next morning, "It was a sight, and theer's some what would give a good deal to have seen it."

The breathless game began, and into the midst of it came Jane Secretan with the weight of unknown things upon her usually cheerful soul.

She pushed open the door softly, having a mind to discern what all the breathless laughter was about. And there was the circle squat upon the floor, Audrey in the middle, brandishing the glittering shoe, her face flushed, her eyes laughing, every eye hanging on her sweet face. Even Lydia Rash had been commandeered, and sat on the floor with the rest, an unbending figure with her skirt pulled round her waist. Jane burst out laughing, and Audrey sprang "I'm so glad to hear you laugh, Miss Secretan. I believe Miss Rash has a secret fear that I'm eradicating the good of a whole year, but don't they enjoy it? Excuse my bare foot. It was the only way to provide the slipper."

The girls would have risen out of respect to the Rector's sister, but waved them back.

"Finish the game, girls. I'm sorry to be late. I couldn't help myself to-night." She stepped bark to hang up her cloak in the little passage, and the momentary gloom lifted from her soul. The world was full of good things after all, and the joy of young life would never fail. How wonderfully was the web

Facts About Motherhood

The experience of Motherhood is a trying one to most women and marks distinctly an epoch in their lives. Not one woman in a hundred is prepared or understands how to properly care for herself. Of course nearly every woman nowadays has medical treatment at the time of child-birth, but many approach the experience with an organism unfitted for the trial of strength, and when the strain is over her system has received a shock from which it is hard to recover. Following right upon this comes the nervous strain of caring for the child, and a distinct change in the mother results.

There is nothing more charming than a happy and healthy mother of children, and indeed child-birth under right conditions need be no hazard to health or beauty. The unexplainable thing is that, with all the evidence of shattered nerves and broken health resulting from an unprepared condition, women will persist in going blindly to the trial.

It isn't as though the experience came upon them unawares. They have ample time in which to prepare, but they, for the most part, trust to chance and pay the penalty.

In many homes once childless there are now children because of the fact that Lydia E. Pinkham's Vegetable Compound makes women normal, healthy, and strong.

Any woman who would like special advice in regard to this matter is cordially invited to write to Mrs. Pinkham at Lynn, Mass. Her letter will be held in strict confidence.

of life woven, she told herself, and if more of the grey threads than the golden ones had fallen to her share, who was she to grumble) She would not grumble. Jane put it all behind her that night and forever, and Audrey never knew how the lightness of heart for which she had feared just one instant that Miss Jane would blame her, had helped a sister over one of the rough places.

Jane's face was pleasant and sunshiny when she entered the room and stood by the desk looking on the animated scene. She counted the girls one by one, noting with satisfaction that there was not a single absentee. The Girls' Club had been Jane's idea entirely, not much approved at first by the Rector, who did not believe in too many organizations. He had argued with her that the Girls' Friendly Society covered the whole ground, but as Jane explained, that did not keep them from the streets or loafing aimlessly about the lanes of an evening or teach them thrifty ways. All right for the older girls; a bond among those actually out in the world, it hardly touched the younger set. So she took them by the hand. It was a red-letter night in the annals of the club when Audrey Hayes came among them. They all loved Miss Jane, and had a sort of compelled respect for Lydia Rash, who gave them cutting-out lessons and taught them the varying uses of the needle, but these were chastening exercises in comparison to what Miss Audrey brought. She was all gaiety and fun, and so sweet with it they simply adored her. She was only eighteen, and the sun had shone upon her through all her sweet young life, but her heart was quick and sympathetic. Perhaps that was why she quickly discerned that evening that the Rector's sister was not quite herself.

She seemed absent-minded and far more inclined to let Audrey herself take entire command of the proceedings. Audrey, imagining her tired, did her utmost to relieve her, and the hour passed all too quickly.

The girls left before the carriage came to fetch Miss Audrey, but Lydia Rash would not permit them to hang about outside for another glimpse of her. She marshalled them sternly down the lane, and Miss Secretan was left alone with Audrey.

"You look so tired dear Miss Jane," said Audrey, who had a warm affection for the Rector's sister, and secretly resented the fact that her mother so seldom invited her to High Ridges. Mrs. Hayes cultivated only such visitors as were likely to shed lustre on her big house and had long since set Jane Secretan down among the dowdies. Besides, she frankly disliked her because of her plain speech, and the feeling of rebuke she was able to convey by a glance of her honest eyes.

Jane did not mourn the dearth of invitations to High Ridges, though she had a sincere respect and honest liking for Mr. Hayes and loved Audrey. Love indeed flowed upon sweet Audrey Hayes as the flowers naturally turn to the sun. It was impossible to imagine her in any other atmosphere.

"I think I am tired," replied Miss Secretan, and Audrey noticed a little nervous movement of the hands, as she gathered up the hymn books from which the girls had been singing the parting hymn.

"Let me do that, Miss Jane, and do sit down, you look so tired. The brougham won't be here for another ten minutes. I said a quarter-past nine. Papa saw Mr. Secretan tonight, and he told him he had been to Essex."

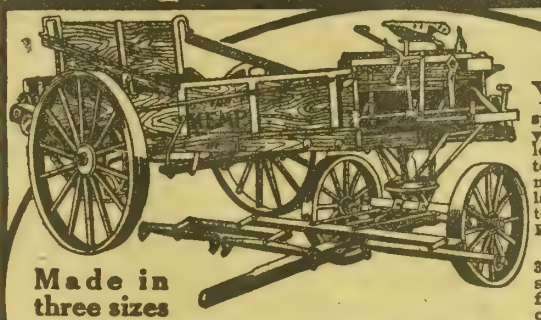
Inside Facts About Kemp Manure Spreaders



Made in three sizes

Strong Where Others are Weak

YOU who continue to spread manure over your land by hand, learn how it is possible to cover three times as much ground with less labor and increase crops 10 to 15 per cent by using the Kemp Manure Spreader.

This spreader is the result of 39 years' experience in building spreaders of all kinds. It is the first one that will handle all sorts of material, thoroughly pulverize and distribute it evenly, and has one-third lighter draft than any other spreader ever built.

The secret of the wonderful success of the Kemp Manure Spreader lies in the Flat Teeth used on the Cylinder Bar. Because these teeth are wide and graded, we need only have one-third as many used on other machines. This does away with the manure backing up and clogging, reduces friction on the cylinder—and correspondingly lightens draft.

The machine is also equiped with the strongest and most practical change of feed ever put on a spreader, while the Apron has a friction return so the operator has it always under control. The Kemp Manure Spreader will economize labor more than any other farm implement and, by increasing the fertility of the land, will pay for itself in no time.

Settle your doubts, once and for all, concerning what kind of a spreader you want on your farm, by writing for our free book B 75 which tells the inside facts about Manure Spreaders. Write today—address,

1/3 Lighter Draft

Handles All Kinds of Material

Why Every Breeder should Have a Typewriter.

After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

A Justice of the Peace Guarantees this Cure by the Use of

Doan's Kidney Pills

Mr. B. J. Thomas, Fisher River, Man., writes:—"I beg to acknowledge a receipt of thanks for the great benefit derived from the use of Doan's Kidney Pills. For some years I suffered from severe pains in my back and could hardly work at all, and when I stooped down to pick up anything I felt as if my back would break. I was advised to try Doan's Kidney Pills, and after taking two boxes I was completely cured and feel that I cannot speak too highly in their favor. It will be two years this April and am still cured and expect to stay cured."

TO WHOM IT MAY CONCERN

I, the undersigned, J.P. of Fisher River, do hereby take oath and swear, knowing the above statement to be true as testified. Knowing all men by this right.

Signed, L. C. ROGERS, J.P.,
Fisher River, Man.

Doan's Kidney Pills are 50c. per box, or 3 boxes for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

"SOVEREIGN" SHEATHING FELT.

(Trade Mark Reg.)

is really light-weight Ruberoid Roofing. It is made of the same fabric with wool in lighter weight, saturated and coated with the same **Ruberoid Gum.**

SOVEREIGN Sheathing Felt is clean, odorless, waterproof, germ and vermin proof, fire-resisting and practically indestructible.

Its insulating properties are far superior to those of ordinary building or tar paper. It compares with them somewhat as a blanket does with a sheet. The use of "Sovereign" Sheathing Felt means a far warmer house in winter, and a yearly saving in coal bills. Thus the small extra cost is more than returned to you.

Ask the nearest Ruberoid dealer for sample, or write us direct for sample and Booklet G.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

One of the most common ailments that hard working people are afflicted with is lame back. Apply Chamberlain's Liniment twice a day and massage the parts thoroughly at each application, and you will get quick relief. For sale by all dealers.

When writing advertisers please mention the Maritime Farmer.

Jane nodded and turned to place the little pile of red books in the cupboard. When she stepped back she looked straight into Audrey's face with an odd little smile.

(To be continued.)

Lengthening Life of Wearing Material.

There are many articles of clothing put aside by the owners as not presentable and new ones purchased, though the money ought to be put away for a rainy day, or be used for other purposes. On lacking the money the things are worn though the wearer is conscious that his or her appearance is spoiled thereby.

This need not be, if one takes the time to make necessary repairs as the need occurrs and to clean all spots or stains. As cleaners, gasoline and alcohol are both excellent, gasoline is cheap and will freshen any garment that is dusty and dirty in a general way, but will not remove the grease spots. Alcohol will do this and it will also remove gummy spots Warm water will clean spots made from syrups or candy. Turpentine will remove dry paint and gasoline will remove fresh paint.

If a garment gets spattered with mud, let the mud dry, then brush off and sponge the spots with cold water. If the fabric will not bear water try alcohol. All cleansers including those named as well as naptha, benzine and chlorform are more or less inflammable and should not be used in a room where there is ailight or an open fire. Gasoline will do most effective work if heated. This can be done by setting the vessel containing it into a larger one partly filled with boiling water and covering until the gasoline is used. If the articles are very dirty soap may be melted and rubbed on the soiled places and these spots rubbed till the soap is removed. In washing such articles they should be rinsed in clean gasoline. The gasoline should not be thrown away, but be allowed to settle and poured back into the receptacle in which it is kept.

Gloves, veils, hats and trimmings of all kinds can be cleaned with gasoline and when thoroughly cleaned, if faded, they may be restored to their original color or changed to some other, by getting tube oil paints and adding such a quantity to the gasoline as is needed to make the shade desired. In case roses or other flowers are to be shaded apply a stronger dye with a brush to the darker parts.

Felt or velvet hats can be very much improved by a sponge bath with gasoline and black coats or other articles, which are getting rusty, may be restored by sponging well with gasoline to which black tube paint has been added. Laces may be freshened by a bath in gasoline, and they may when clean, be dyed to match any colored dress or hat by using tube paints as mentioned, the different light shades being particularly successful. These directions will save visits to the cleaner and dyer, supposing they are in convenient distance, which is not always the case, and even if they are, they charge so well for their services that unless time is money one had better do the work at home if one knows how.

With wearing apparel clean and pressed and mended neatly, there is a feeling of self-respect which makes it easier to face the world, and we are less ready to succumb to "the stings and arrows of an outrangeous fortune," or rather they pass us by, because we are able to show a brave front. The moral support of presentable appearances is much greater than some people credit it with being.—Cena S. Cornman.

Baled Hay Pays Best Whether Fed or Sold

STACKED hay exposed to the weather wastes the hay crop and decreases its food value. Loose hay placed in the barn takes up too much room and gathers dust.

When you bale your hay there is no waste—no dust—and your entire hay crop can be kept under cover. Baled hay retains its full nutritive value and remains in excellent condition for feeding. It is easy to handle and always ready for quick sale anywhere

I H C Hay Presses

have many points of strength, simplicity, and convenience found in no other presses. These presses are constructed almost entirely of steel, and are strong and durable without being excessively heavy or clumsy. They are equipped with a compound lever and toggle joint plunger, which gives them their great compressing power. A 500 pound pull on the sweep of a 16 x 18 I H C press gives 76,800 pounds pressure in the bale chamber.

The bed reach is only about 4 inches high and very narrow. The bale chamber is very low—easy to reach over to tie the bale.

I H C hay presses are supplied to be operated with either one or two horses, and the International Motor baling press is furnished with a 3, 4, or 6-horse power gasoline engine which can be detached when the baling season is over, and used to operate other farm machines.

Call on the I H C local agent for catalogue and prices, or, if you prefer, write nearest branch house.

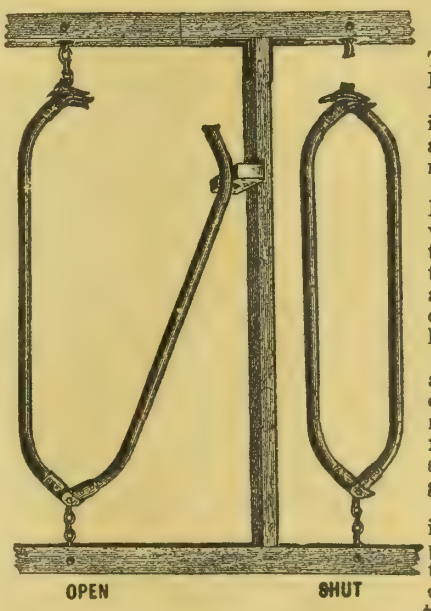
The Young Folks and the Farm.

People who have always lived in the country, especially boys and girls who have been raised on farms, often fail to appreciate the privileges that farm life offers. There are hundreds of men and women, bound by circumstances to live in cities, who look upon the quiet, comfortable well conditioned life on the farm as the ideal life. Men and women who have chosen farming as their life work need no persuading. It is the boys and girls whose judgment is unformed who need the advice, or the quiet unobstrusive influence that satisfied parents can offer. A boy's or girl's point of v:'ew depends much upon the atmosphere of the home. We're all too likely to strive for something we have not, instead of making the most of privileges we have. Because the young folks have always lived in a home where there are quiet and comfort and plenty, they lose sight of the blessing of such a life. Keep before your children constantly the fact that farm life is a privilege—talk about it, not obtrusively, but in quiet little hints and comparisons—feel it yourself and live it, so that your actions convince them and they will be influenced. Then make these privileges available to them. It is not to be wondered at that young peole grow tired of the life in some farm homes, where there are no amusements, no company, no books nor periodicals to read, where the best parlor is shut up till it is musty and the advent of company causes flurry and excitement. There is always work to do on the farm, but there are compensations if parents will make them available. Country life need not be lonely unless we make it so. Nowhere can be found a more sociably inc.ined class of people than on the farm, nor people more hospitable. Every neighborhood should make its own amusements, and the more sociables and picnics we have, the more united will be the community, and the more contented the young people. If it is a trial and strain on the nerves to open your home to guests, there is something wrong with the hospitality you are offering. Your guests will feel the strain, for there is bound to be a stiffness that will spoil everybody's fun. It doesn't matter whether your house is in absolutely perfect order, or whether you have the very nicest refreshments that you could serve. What guests appreciate above everything else is a cordial hospitality that makes them feel they are welcome.

Let your boy or girl have company often, make the young folks feel welcome in your home. Plan the work and exchange tasks with the young folks occasionally so they can get away from home early. Be interested in their fun, and make them feel that you want them to have a good time. And all the time keep it before their minds in a quiet, unobtrusive way, that nowhere save on the farm could they enjoy such care free happiness such a comfortable life.

LOUDEN'S

Tubular Steel Stanchions



Can you Beat Them ?

We think not, LOUDEN'S TUBULAR STEEL STANCHIONS are SECOND TO NONE.

The Pipe is made of Steel Tubing 1 1-2 inches inside diameter, and 1 15-16 inches outside diameter.

The Couplings are of Malleable Iron, bolted together. The thin webs grip the piping so tightly that it is not necessary to drill it to insure a solid joint. There are no rough edges to chafe the cow's neck or accumulate and hold the dirt.

These Stanchions are fastened at top and bottom by a strong chain which allows a free movement and yet prevents the cow from getting into the Manger or stepping backward into the gutter.

If you are interested in Stanchions write us for free circulars, prices, etc. Thousands of cust tomers are delighted with our goods. You will be if you use them.

EXCURSIONS TO WESTERN CANADA.

The Grand Trunk Railway System announce that on Tuesday; June 13th and 27th, July 11th and 25th, August 8th and 22nd, September 5th and 19th, 1911, Homeseekers' Excursions will be run from all Stations in Ontario and Quebec to Western Canada, via Chicago and Duluth or via Chicago, St. Paul and Minneapolis, at reduced round trip fares.

The well-known double track line of the Grand Trunk from the East of Chicago appeals to the traveller, and with the superior train service that is offered by this line, including the famous "International Limited" from Montreal daily at 9.00 a. m., and which is the finest and fastest train in Canada, many passengers will be attracted this way. The route via Chicago is a most interesting one, taking passengers through the principal cities and towns in Canada and in the States of Michigan and Indiana. In addition to this a choice of seven lines between Chicago and St. Paul and Minneapolis is offered.

Owing to the great number of Canadians who reside in Chicago, St. Paul, Minneapolis, Duluth and other cities en route, there is no doubt that the Grand Trunk will find many patrons who will take advantage of the opportunity thus afforded them for a brief visit at the stations with their friends.

Canadian citizens are exempt from so-called Immigration Examination, and there is no detention at any point.

Baggage is carried through the United States in bond without requiring any special attention on the part of the passenger. Inspection is not necessary at any of the points at the Border.

Another feature that will appeal to the homeseeker is the comfortable transfer at points like Chicago, St. Paul and Duluth into freshly ventilated clean cars, avoiding the necessity of travelling a long distance in the same car.

In addition to the above routes, the sale of tickets is also authorized via Sarnia, and the Northern Navigation Company's magnificent Steamers across Lake Huron and Lake Superior.

For further particulars apply to any Agent of the Grand Trunk Railway System, or write to Mr. J. Quinlan, District Passenger Agent, Bonaventure Station, Montreal, or Mr. A. E. Duff, District Passenger Agent, Union Station, Toronto.

A vast amount of ill health is due to impaired digestion. When the stomach fails to perform its functions properly the whole system becomes deranged. A few doses of Chamberlain's Tablets is all you need. They will strengthen your digestion, invigorate your liver, and regulate your bowels, entirely doing away with that miserable feeling due to faulty digestion. Try it. Many others have been permanently cured—why not you? For sale by all dealers.

Some Rules for Making Jam.

If not desired to keep the fruit whole, it is best to boil it up first before adding the sugar, which should be warmed. This is a safe rule in damp weather, or with fruit that has been ripened wet.

When water is required to boil dry fruit, allow 1 gill to each pound.

If jam boils longer than 20 minutes both appearance and flavor suffer.

In very dry seasons less sugar is required, and more water may be added.

Jam should boil quickly—that is, the whole of the pan should be boiling through, as if it boils slowly the time is much longer, and the color is not so good.—Gretchen.

Lots of Shelves.

How many people realize how addicted we are to the use of shelves in almost every room in the house, from the living-room with its beautiful mantel to the bath-room with its bevel-glass shelf? In the library the once common use of a bookcase has long since given way to the more pleasin and convenient device of building into the room long sections of shelves for books. Once we are thoroughly at home, even in our own individual rooms, we are apt to find that our small personal treasures demand some such resting place. If this is true in the main part of the house, it is equally so in the domestic quarter—in kitchen, laundry and pantry. Neat shelves filled with well secured pots and pans, and underneath them trim lines of hooks for drainers, ladels, etc., add not only to the convenience but also to the cheerful and businesslike air of these rooms. To insure the greatest degree of cleanliness, however, it is well never to have any such shelves above the level of the eye, or out of easy reach of the hand.

Clothes Moths

Woolens and furs may be kept from injury during the summer months by inclosing them in air-tight receptacles, preferably in a perfectly tight chest made for the purpose, and placing in a shallow dish on the top of the goods some bisulphide of carbon, at intervals of three weeks, two or three times during the summer. The odor of a cedar chest, and of moth balls, may be repulsive to the insects but does not kill.

It is usually unsafe to allow woolens or furs to remain undisturbed a long time in an ordinary trunk, since as a rule, such trunks are not moth proof. In my own home I use a galvanized iron chest 2 feet square at the ends, and 3½ feet long. Six hooks on the cover serve to hold it tight to the chest. A chest of this size takes four tablespoonfuls of bisulphide at an application, and should not be opened for three or for days after the liquid is placed therein. No light should be brought near bisulphide of carbon, as the gas coming from the same is explosive.

Suspiciousness.

Two women were talking together. Said one, "I think that he'll bear watching, and I'll tell you some other people to look out for, too."

"Oh, no," broke in the other with a bright smile, "don't tell me. I've lived here fifteen years and never had the slightest cause to doubt the honesty of my neighbors, and I don't want to begin now. I would feel dreadful if I really thought that any of my friends would take things that didn't belong to them. Oh, I'm sure Mrs. B——, that you'll find your rake. Don't you think that possibly one of the children has been using it and carelessly laid it down?"

"No, I don't," sad Mrs. B——, a little chagrined at the want of sympathy in the other's hopeful tones. "My children have been trained to put things up when they use them."

I knew both speakers well. Their social status and even in a measure the homelife of each was familiar to me. The one was continually having things taken, fruit, chickens, garden tools, etc., and one person after another came under the ban of her suspicion. Whether the missing articles were actually stolen or merely mislaid and overlooked was always a matter of conjecture in the neighborhood. But however that may have been, various articles were continually being missed; and, indeed, persons who would not have stooped to do a dishonest deed had actually been accused of pilfering berries from the farther patch before sunrise on summer mornings.

People resent inferences of this sort against their character, and it naturally followed that Mrs. B—— and her family were not very popular in the community. The other woman's nature was the very opposite. Sunshiny, bright and generous in her estimate of men's characters, people loved her, and even the lowest of her acquaintances were anxious to appear, at least in her eyes, to come up to the standard that she had set for them. I do not believe that the vilest person in town would have stolen from her, but whether the other woman's property was equal-

OWNERS ARE PROUD OF I H C WAGONS

There is a certain pride in owning a wagon that you know is built of the highest quality materials obtainable—a wagon that is not only attractively finished with the best paint and varnish, but which also gives perfect service, day after day, and year after year. That's why I H C owners are so proud of their wagons.

If you want to be proud of your next wagon—choose one of these two in the I H C line—

Chatham or Petrolia

The loads they carry, the roads they traverse, and their wonderful durability make others wish they had bought a Chatham or Petrolia.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Petrolia Wagons are constructed of first quality woodstock which is thoroughly seasoned by being air-dried. The ironing is of the very best. The inspection of each part is most rigid.

Be sure to call on the I H C local agent, get a pamphlet, and let him show you one of these wagons. If you prefer, write the International Harvester Company of America at nearest branch house for any information you want.

IHC Service Bureau

This Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

E. A. A. GRANGE, V.S., M.S., Principal.

ly safe or not, I do not know.

But laying aside all questions of loss and accusation, what a difference the attitude these women assumed toward their neighbors made in their own lives. The one, hopeful, sunshiny, alert to see the good in others or the need of a helping hand; the other, moody, irritable, dissatisfied, sure that people were saying unkind things about her, suspicious. Life robbed of most of the natural everyday enjoyment that is the birthright of every normal person, merely because she had allowed the seeds of suspicion to grow in her soul, until it had poisoned life, and in a measure, had harmed the lives of every member of her household besides estranging many an otherwise good neighbor.

There are, of course, instances when it is utterly impossible to entirely quench suspicion but even in these instances it is only kind to keep those suspicions to ourselves, at least until they are confirmed by actual and indisputable proof.

But suspiciousness in itself is a contemptible trait. It will be well for every one of us to exterminate the first little budding symptoms of its growth.

People usually find about what they are looking for. If it is kindness, love and honesty, they will find them. If it is ill nature, dishonesty and vice, they will find these also, but it is much pleasanter and life will be much more worth the living if we search for and find the good things.—Pearl White McCawn in the Farmers' Review.

Lemons and their Uses.

If you feel "so tired" and your bones ache and you have a bad taste in your mouth, squeeze lemon juice into fresh water enough to make a sour beverage, and drink freely.

For Headache—If you have a throbbing headache, drink the juice of one-half lemon in fresh water, repeat the other half in one-half hour, and rub the slice of lemon over brow and temples and the pain will soon go away.

Heartburn—Lemon juice taken before meals will be found advantageous as a preventive and cure for heartburn.

Fevers — When the mouth is parched and dry, a little lemon in warm water given in small doses will refresh the patient.

Dyspepsia—Juice of one-half lemon in a little warm water before meals; avoid sweets, repeat for several days.

Rheumatism and Gout—Juice of a lemon in a little warm water at retiring.

Colds and Coughs—Juice of two lemons, add ten drops of camphor and a tablespoonful of granulated sugar, mix and take a teaspoonful every half hour.

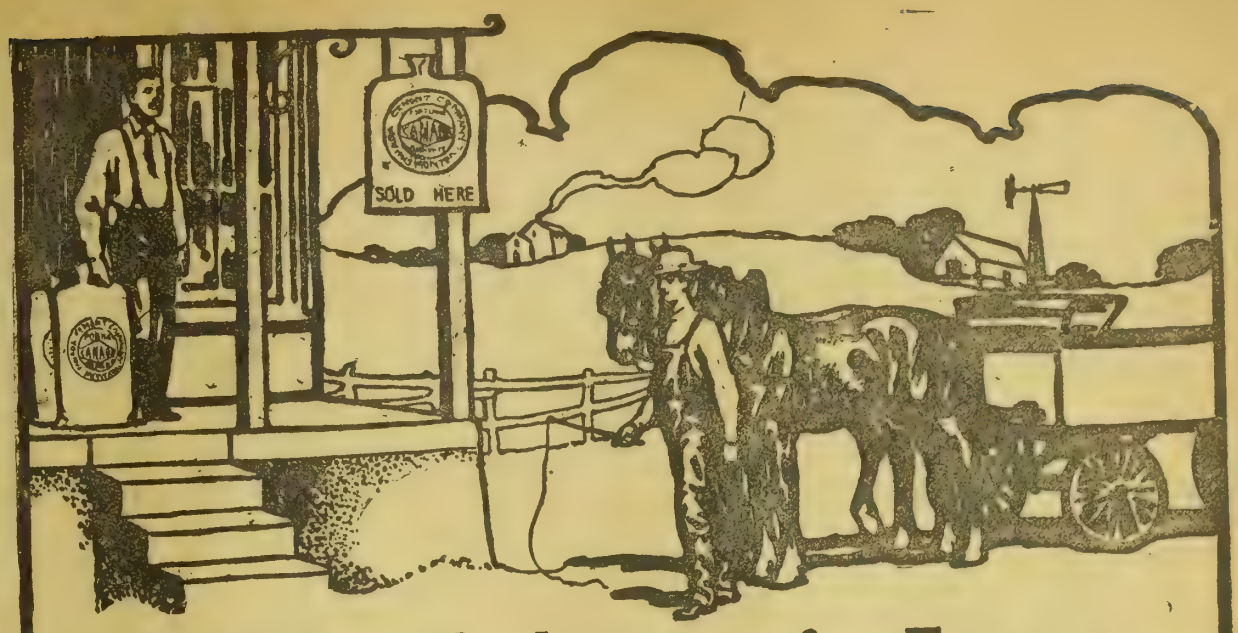
For the Hair—For falling hair rub slices of lemon into the roots, wash afterwards with soft, warm water.

For Complexion—Lemon juice and milk, rub on face and neck, leave on all night.—Exchange.

Washing Blankets.

A woman who has some blankets 10 years old that are as fluffy as the day they were bought says she washes them with soap jelly. She shaves a half-bar of yellow laundry soap and pours this into a pint of boiling water; she stirs this until it becomes a thick jelly and pours it into three buckets of lukewarm water. Into this she puts the blankets and washes thoroughly. She does not rub soap on the blankets. She puts them through a wringer and in another tub of clear lukewarm water. Then she keeps on rinsing in clear water until every particle of soap is removed, and hangs them in the hot sun, taking care to hang them perfectly straight.

She leaves them in the sun for several hours until perfectly dry; then she beats them with a rattan beater, as she would rugs and furniture. This brings up the nap and makes them fluffy.



$3,600 in Cash Prizes for Farmers

WHEN you enter the Canada Cement Prize Contest, your dealer will assist you. Consult him in reference to conditions of the contest. Refer all questions of doubt to him to decide. Confer with him when his experience and advice and his knowledge of our plan would seem helpful.

Don't hesitate about doing this. We have requested him to assist to the best of his ability any farmer in his locality competing in this contest—whether it's a matter involving the application of cement, or how to go about winning one of the prizes offered in this contest. Do you realize that you have as good a chance as the next man to win one of these prizes? There are four for each Province, as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911, the greatest number of bags of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who in 1911 uses "CANADA" Cement on his farm for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work shown by accompanying photograph, was done.

Contest will close on November 15th, 1911, and as soon as possible thereafter, prizes will be awarded.

Be sure and get a copy of our Contest Circular, telling all about the contest. Ask your dealer for one or use the attached coupon, if you find it more convenient.

In writing us, mention whether you have received your copy of "What the Farmer Can Do With Concrete," a profusely-illustrated 160-page book, which tells you how to build with concrete, so that you can do much of the work yourself. It's a mighty handy and useful book, and should save you many a dollar. Farmers who have received it, say it is splendid. Write to-night and it will go back to you with Prize Contest Folder, by return mail.

Please send Circular and Book.

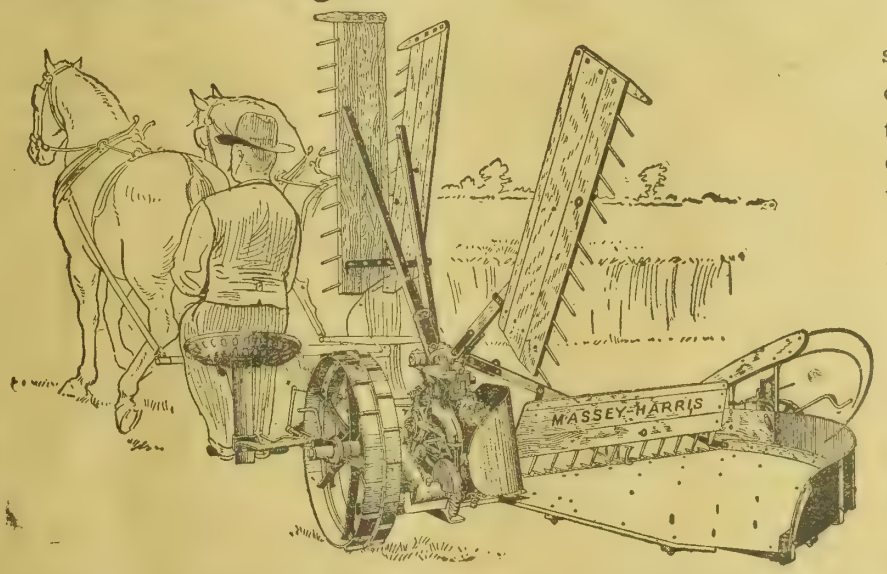
Massey-Harris Reaper.



The only Reaper with a steel platform. The large drive wheel gives ample traction. Gears are well protected by shields. Will cut clean without digging into the ground. Pitman has steel strap at knife end and brass bushing at crank end. Driver has perfect control of the Rakes. Platform is easily raised and lowered. Main wheel runs on Roller Bearings. Table is easily tilted by convenient lever. Machine can be folded for transport easily and quickly.

THE MASSEY-HARRIS CO., Limited, Moncton, N. B.

"Were all medicines as meritorious as Chamberlain's Colic, Cholera and Diarrhoea Remedy the world would be much better off and the percentage of suffering greatly decreased," writes Lindsay Scott, of Temple, Ind. For sale by all dealers.

Plants and the Sick Room.

In the dark, plants exhale carbolic acid gas and consequently add an impurity to the air. This is the reason why many people say they are undesirable in bedrooms. Under the influence of sunlight, however, they take up carbonic acid gas, of which they retain the carbon and set free the oxygen, and so become great air purifiers. When we take this into consideration, along with the fact that the quantity of carbonic acid gas given off at night is so extremely small that Miss Florence Nightingale, when pleading for plants in the sickroom, said it "would not poison a fly," we must come to the conclusion that plants in a bedroom are certainly desirable whenever there is convenient space for them.

Keeping up the Pasture.

Judging from the English system of maintaining permanent pastures and hayfields in a high state of productivity, the secret of succesfully maintaining a rich growth of grass in pastures lies in fertilizing them. Since the Canadian farmer does not have as much farmyarrd manure at his disposal in proportion to his acres as the English farmer does, the question of how to fertilize his pastures naturally arises. The English farmer uses his farmyard manure on his pastures; the Canadian farmer uses what farmyard manure he has at his disposal on his grain crops. Shall he use commercial fertilizer?

The experience of an Ohio farmer co-operating with the Ohio Experiment Station is important in this regard. A five acre pasture lot was divided into five acre plots in the spring of 1907 and treated as follows to determine what kind of fertilizing material should be used for the purpose of improving pasture growth: Plot 1 was fertilized with 8 tons of stable manure. No. 2 with 320 lbs. of acid phosphate. No. 3 was unfertilized. No. 4 with 200 pounds of bone meal, and No. 5 with 320 lbs. of muriate of potash. Lime was not used as it was the opinion of the Experiment Station authorities who made laboratory tests of the soil that no lime was needed. A liberal seeding of timothy, alsike, red clover and red top seed was made early in April after the old sod had been fairly well cut with a disc harrow.

It was plain all season, the farmer reports to see that the stable manure plot was making the more vigorous growth. But little difference was to be noted between the other plots on which commercial fertilizer was used. Not much growth was to be observed from the new seeding during the first season but the following spring the growth from it was surprising, the clover showing up beautifully and the mixture of grasses affording excellent herbage during the grazing season, and the conclusion is that manuring discing and reseeding the old sod early in the spring will pay abundantly. It is doubtful if there is a better method. It will pay farmers who have land in permanent pasture to apply their farmyard manure upon it at intervals of three or four years in this manner, and to use commercial fertilizer upon the plow land in its place whenever such use is made of it. A permanent pasture well manured, disced and reseeded at regular intervals not too remote in their occurrence will maintain an excellent herbage all through the grazing season and will thus mean a great saving on the summer feed bill now usually made necessary for a lack of pasture growth during the drought period of July and August.

N. M. RUTHSTEIN—
The Steel Shoe Man
—He Has Made a Million Feet Happy

Read Why Steel Shoes Correct All Feet Ailments—Protect Health—and Save You About $20 a Year

Then decide whether or not you want to *try* a pair—to prove to yourself that all I claim for my Steel Shoes is true.

HOW OFTEN we hear, "If it wasn't for my feet I'd be all right"—"My feet are simply killing me," etc. 98 out of every 100 such troubles come from wearing the wrong kind of shoes. Leather shoes get wet with moisture from the outside—and from perspiration on the inside. The socks become moist—the leather and the sock stick together—thus the friction—the rubbing—all comes on the flesh of the foot. What's the result? Blisters, bunions, burning sensation, sore, aching feet, tired ankles, actual torture.

Leather shoes always break down in the arch—causing the insteps to break also, and the result is known as Flat-foot—the most intolerable, uncomfortable, incurable disease that can happen to the laboring man's feet. If it hasn't happened to you, don't run the chance of it another week. Get my Steel Shoes now. It it has happened, my Steel Shoes will prove a double blessing to you.

For Your Health's Sake

It is impossible for you to have any of the above troubles wearing these wonderful Steel Shoes. Try a pair at your dealer's. See how Steel Shoes are made in the natural form of the foot—ample room for all the toes to lie in their proper positions. Note how the friction—the *rub* in Steel Shoes lies between the shoe and the sock—so you can never be troubled with blisters—corns—or bunions. My Steel Shoes positively cure tender, aching feet—and I can prove it.

And you can never catch cold in a Steel Shoe—you never suffer from a lame back—from a sore throat—tonsilitis—or lumbago or sciatica, rheumatism or pneumonia, or any of the other ailments that can be traced back to a common cold caught from working with wet, cold feet.

When you try on a pair of Steel Shoes you'll see why it is impossible to run a rusty nail into your foot—which oftentimes results in lockjaw—why it's impossible to slip or slide or fall in them—as they are fitted with adjustable steel rivets which may be quickly replaced at any time—50 extra rivets cost only 30c and will keep your shoes in good repair for at least two years.

To Dealers

Get in line with the leading merchants of Canada and supply your customers with my Steel Shoes. Save them the bother and delay of ordering direct—as they do when dealers disappoint them. A man who knows Steel Shoes will have no other kind—he knows their extra comfort, extra health and economy features. Write for terms today to Blachford, Davies & Co., Ltd., 60-62 W. Front Street, Toronto.

Do it now and give your customers a square deal on the work shoe question.

To Western Dealers

Write for terms to George G. Lennox, 87 King Street, Winnipeg, Manitoba, sole selling agent for Manitoba, Alberta and Saskatchewan.

Foot Comfort and Economy

Go to your dealer at once. Try on a pair of Steel Shoes and see why they feel like an old carpet slipper on your feet from the time you put them on until you take them off. 750,000 farmers now wear them. Steel Shoes are the most economical shoes you can possibly buy. One pair of them will outlast six pairs of leather shoes. Steel Shoes are sold direct from my factory to the user, on Free examination and Try-on in your home—if your dealer can't or won't supply you.

Free Trial and Try-on Plan

I want you to try a pair of Steel Shoes. I want you to prove—in your own way, and to your own satisfaction—that everything I claim for these wonderful shoes is true—and that I do not claim half enough for them. See your dealer or, if you prefer—you can order direct from this advertisement—I give below prices and sizes. All you need to do is to give me the size of the leather shoe you wear—and I'll ship you, by return express, a pair of my Steel Shoes—guaranteed to fit you. Examine them carefully when they arrive—put them on two or three times—walk around in them—see how they feel—see how light and comfortable they are—convince yourself that they must give a tremendous amount of wear—satisfy yourself in every way—or let me know and I will send for them at my expense.

If you prefer—write for my booklet "The Sole of Steel". But act now—either go to your dealer and see a pair of Steel Shoes or order a pair direct from this advertisement—which you are perfectly safe in doing if you wish to get the shoes immediately—or send for the booklet and further details.

Four Styles—6, 9, 12 and 16 inch Tops—in all sizes—For Men and Boys

Steel Shoes 6 in. high, extra grade leather, black or tan color, $3.50 per pair.
Steel Shoes 9 in. high, extra grade leather, black or tan color, $5.00 per pair.
Steel Shoes 12 in. high, extra grade leather, black or tan color, $6.00 per pair.
Steel Shoes 16 in. high, extra grade leather, black or tan color, $7.00 per pair.

Boy's Steel Shoes—Sizes 1 to 4

6 in. high, Boy's Steel Shoes $2.50 per pair.
9 in. high, Boy's Steel Shoes black or tan color, $3.50 per pair.

In ordering give correct size. Boy's Steel Shoes will please the boy and save you money and worry.

Each pair of Steel Shoes is worth $2.50 more than the regular working shoe.

For all classes of use requiring high cut shoes our 12 or 16 inch high Steel Shoes are absolutely indispensable.

Always Have a Pair of Steel Shoes Ready

—no matter how many pairs of leather or rubber boots you have. Most people keep their feet out of condition most of the time "breaking in" new leather shoes. My Steel Shoes have a hair cushion on the bottom, insuring ease and perfect comfort right from the start. They need no "breaking in." Now don't you want to try a pair? Go to your dealer, pick out the size and style of Steel Shoes you want—try them on and see if everything I've said is true or not. I leave it to you. Or, if you prefer, send me the price, and I'll ship the Steel Shoes you want by return express the day I get your order. If they fail to satisfy you immediately, you can simply notify me to send for them at my expense, and your money will be refunded *at once*.

To Exterminate Ants.

"After 40 years of warfare, I have finally exterminated both the black and small red ants by the use of tartar emetic," says a Wellington, O., correspondent of the Country Gentleman. "Five cents' worth put in flat dishes and kept moist with water, set in every cupboard and corner they infest, has entirely driven them away. I did not find dead ones; they just disappeared. It took two years, a few appearing the second year. The red ants were most persistent, but they are gone, too."

Feeding Skim Milk.

As regards the feeding of skim milk in order to secure the best results from its use, experiments along this line have been conducted at the various experiment stations. At the Central experimental farm at Ottawa, considerable work has been done in this connection. In commenting on this work, Prof. J. H. Grisdale says:

"Skim milk is often fed by our farmers too lavishly. They have a considerable quantity of it and have few pigs, and therefore the pigs receive all they will drink—sometimes more. I have seen farms where there was skim milk standing in the troughs all day. This is not only extravagance, but wilful waste. If we are to make the best use of our dairy products, as we should, there is no better way to use them than for bacon or pork production. But if we are going to use them at a profit, we must use them economically.

A series of experiments was conducted at the experimental farm some years ago to determine the amount of skim milk that was most profitable to feed to young pigs. To some we fed as high as 30 pounds a day—all that they could possibly drink, and they received hardly anything else; and to others we fed as low as two pounds a day. We kept account of the amount of milk that each lot was fed. We valued the skim milk according to the results it had when fed along with the meal, and the results obtained were as follows: Where we fed 30 pounds a day of the skim milk—all they would consume in addition to a small amount of meal—the milk was worth about eight cents a 100 pounds. Another lot received 25 pounds a day, and we found that the skim milk was worth 10 cents a 100 pounds. Other lots got about 20 pounds of skim milk a day. Where we fed 20 pounds a day the skim milk was worth about 12 cents a 100 pounds. When we fed 15 to 18 pounds, was worth 15 cents. When we fed from 10 to 12 pounds we got a little over 20 cents. When we fed eight pounds we got 25 cents. When we fed from four to six lbs., it was worth over 30 cents a 100 lbs. Where we fed from three to five lbs., it was worth a little over 40 cents. Now, you see the wonderful increase in value that the skim milk underwent when fed in small quantities.

Skim milk is valuable not only as a feed, but it acts as an aid to digestion or helps to digest other feeds, and makes them more valuable. Where we fed meal alone, it cost us $4.50 for 100 pounds of bacon; where we fed skim milk with it at the rate of from three to five pounds a day, valued at 50 cents a 100 pounds, it cost us only $3.50; and where fed in addition a small amount of roots it made the cost even less. The farmer who feeds his pigs all the skim milk they can possibly drink is **extravagant and wasteful.**

Plowing for a Level Surface.

An entire field, if square or oblong, may be plowed more quickly, much better and without a dead furrow in the acerage. Assuming that the field is oblong; beginning at one side, near the end, pace the distance across, then pace back one-half the distance and you will be at the middle of the field, lengthwise.

Put a mark here. If the field is two hundred paces wide you will have one hundred paces to the centre. Now go to the end, opposite your mark, and pace inward ninety-seven paces, keeping exactly on a line with your mark. At this intersection place your mark.

Now go to the opposite end of the field and do exactly the same, setting a stake at the intersection that can be seen from the first mark. Now take the team and start the plough just at the first mark and plough a straight line to the stake, but not beyond it. Turn and plough back, throwing furrows together, and repeat until the ploughed land is just six paces wide. Up to this time you must not plough across the end. As soon as you have the six paces you will have balanced the three paces you were short at the ends and will be equi-distant from the sides and ends of your field. Now begin to plough across the ends and continue to plough around until the entire field is plowed. The soil will all be thrown inward and not a dead furrow in the field will there be.

Horses' Sore Shoulders and Necks.

A bulletin issued by the Veterinary Department of the North Dakota Agricultural College contains some useful hints as to the prevention and treatment of sore shoulders and necks in horses:—

Sore shoulders are, as a rule, due to an improper fit in collar or hames. Occasionally uneven surface or hard, lumpy areas in the filling may be the cause, or improper care of the horse in early spring before the skin and underlying tissues have become hardened to the collar pressure. Diseased conditions of the foot or limb may cause sore shoulders from an abnormal gait. A horse's collar should be fitted with greater care than a pair of patent leathers on an aggregation of bunions, corns and ingrown toe nails. The collar should be well made, with a fair amount of springiness on pressure, smooth, even surface, and adapted to the use required; as, for instance, a heavy collar for heavy draught work, while a lighter one can be used for driving horses. Let it be sufficiently long that the hand may be easily passed between the front border and the side of the neck. This rule varies somewhat, of course, in the various types of horses, as some thick-necked horses expand the neck when drawing a load. These will require a slightly wider collar. Let the collar fit snugly over the entire bearing surface.

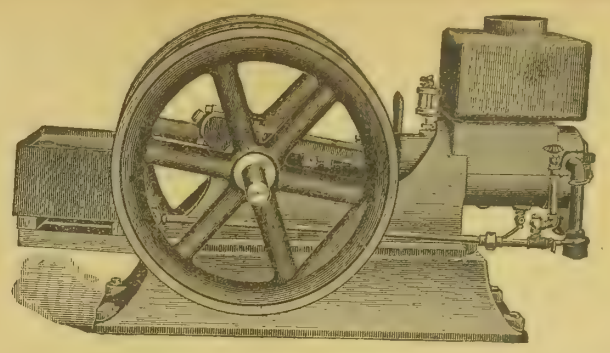
Having fitted the collar, next comes the fitting of the hames to the collar and the proper adjustment of the height of the attachment of the tug. A good rule to follow is to have it come about one-third of the height from below. This may need to be varied somewhat, ae we consider the angle at which the hook passes from the hame, and whether the horse has a free or check rein. In well made hames, this hook passes out at a right angle, and is easily adjusted. If placed too low, the point of the shoulder shows abrasion and soreness. If too high, the soreness will be found just in front of the upper part of the shoulder blade. Occasionally a sore neck results from this cause, but rarely if the collar is of the proper length.

When sores occur, seek the cause, correct it, then aid nature in effecting a recovery. Having removed the cause, wash well after each day's work, and dust with any good antiseptic powder, or easier still, dampen well after washing with a solution of bichloride of mercury and tannic acid in a quart of soft water for this purpose. It will keep for weeks, costs but little, and is easily applied. Dusting powders made up of boric and tannic acid are equally effective or zinc oxide may be used. Dry sulphur and air-slaked lime is a favorite mixture with some, and is quite good. Prevention is worth the proverbial amount of cure, and consists in carefully-fitted collars. The use of pads is larly a matter of choice, and we are free to confess that, in twenty-five years of experience in handling work horses, we consider the arguments pro and con as about even. We have made it a rule to use pads only with the smaller and lighter collars when used in the heavy work. Galled shoulders frequently result from the use of a sweat-soaked pad or one wet in a heavy rain. Careful washing of the shoulders with some astringent solution during the first few days of early spring work toughens the skin, lessens the action of the sweat glands in that region, and gives many a faithful horse relief from the daily torture of a sore shoulder. Sore necks in horses are due usually to one of two causes; a short collar, or to too great weight coupled with the side motion, as noted in a two-wheeled vehicle. A horse can carry quite a heavy weight on the neck, provided there is no jerking sidewise. Treatment is the same as for sore shoulders: Remove the cause, then wash well and treat with an antiseptic and astringent wash or powder.

Oat Hay.

The season's hay crop being light in many sections, some stockmen may find their supply a little short of the quantity required to meet the demands made upon iit by their animals. Where this is the case, it is necessary to make use of whatever material there is at hand that can be used to fill the gap caused by the shortage of hay. For this purpose some use oats, which, if cut at the right stage, can be made into very suitable dry feed. If a mixture of peas and oats has been sown, so much the better, as the peas will add an extra amount of protein. Any of the various cereals can be used for this purpose, but very often oats give a larger yield of dried roughage per acre than the others, and consequently are more often employed for this purpose.

A very important factor in the



The Waterloo Boy Gasoline Engine

s like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new postitive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogue is free. Write to-day.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Low Water Wharf at Pleasant Hill Road, Parish of Kars, N. B.," will be received at this office until 4.00 P. M., on Monday, September 25, 1911, for the construction of a Low Water Wharf at Pleasant Hill Road, Parish of Kars, Kings County, N. B.

Plans, specifications and form of contract can be seen and forms of tender obtained at this Department and at the offices of J. K. Scammell, Esq., District Engineer, St. John, N. B., G. Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Evandale, King's Co., N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent. (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 26, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

Inflammation and Suppuration.

I would like to ask through your paper the following question. I have a colt 3 years old this spring, which I used in double work some and to drive. She was used some on Saturday, drove one-half mile Sunday, and stood in the barn Monday. Monday evening she appeared a little lame when watered in the stall. On Tuesday she was in great agony and unable to get her from her stall. I examined her all over and found no sign of cause. She suffered some on Wednesday and that evening commenced to swell on side leg, just above hind fetlock joint on right leg, if anything it was a little toward the back of leg outside, and it continued giving pain and kept swelling till it went above the hock to the quarter. She then got down, and Thursday the swelling broke where it commenced. Quite a lot of puss came out. I cleansed it thoroughly and kept clean till it healed over. The swelling has gone down till now there is a small swelling where it broke, as well as swelling in the cornet; in fact there is swelling all around in close vicinity of this swelling. This has been about two months ago since it started and it gives her a lot of pain still with no heat worth noticing in the leg at any point. Her feet appear sound but a little powdery between frog an toe in the horn. She is a Barrister, and weighs about 1100. She was in the pink of condition at start of the trouble and lost flesh till she was near a shadow from the pain. She is now in pretty fair order but for the past two weeks this leg has just about staid one way. It gives her pain as she will stand and hold it up. The joint is all right as she is able to lift and hold it in most any shape. When she walks now it is with a little hitch but she puts her foot down flat, her muscles between the quarter and back or rump wasted considerable, that is, it kind of fell in; is gradually regaining, but she stands with the afflicted leg in front of other or holds it up most of the time. This is as near as I think it could be described.—H. K.

Ans.—The disease was inflammation in the part, which terminated in suppression, one of the unfavorable termination of inflammation. It may have been caused by a sprain, but more probably by bruising the part by striking it with the opposite foot, causing a contusion which suppurated. The inflammation involved very sensitive and numerous structures, which caused the extreme pain. Good treatment would have been the adminstration of a purgative; seven drams of Barbadoes Aloes, two dram ground ginger, and glycerine sufficient to form a ball given at one dose and for twenty-four hours feeding only wheat bran mashes and water, after that giving two dram doses of Nitrate of Potash in food night and morning for four days; then four drams of Hyposulphite of Soda given in the same way for a week. Bathing the part well with warm water three times a day and applying an anodyne liniment such as Tincture of Opium, one ounce; fluid extract of Belladonna, one ounce; spirits of camphor, half an ounce; liquor ammonia, half an ounce and water, one pint, rubbing small quantity well in after each bathing and then applying a comfortable bandage. If indications of suppuration presents itself which will be known by the hair coming out of a spot, the parts pitting on pressure and a redness at that point, then it is advisable to poultice. Apply the poultice warm and change every eight hours. Boiled turnips make a good poultice as does linseed meal or any substance that retains heat and moisture. It is well to boil the linseed meal or mix with boiling water to kill any injurious germs that may be present when changing the poultice by applying some antiseptic, as a three per cent. solution of creolin or carbolic acid in water. After the abscess points and the pus escapes keep the part clean by washin with warm water and applying the antiseptic lotion until heated. After that a blister will aid recovery. Take Mercury Biniodide two drams, four drams pulverized Cantharadies, two ounces vaseline, mix well and rub into the part from the hoof up over the fetlock after clipping the hair off.—Twenty-four hours after apply-

WHAT! They Need Painting Again?
Let's Buy
Amatite
ROOFING
It Needs No Painting

AMATITE has a *real mineral surface;* it needs no paint to protect it. In rain and sun and snow and hail, Amatite takes care of itself. It needs no coddling; there is no maintenance cost. You lay it and leave it.

The mineral surface is durable, permanent, absolutely weatherproof, unaffected by climate, insoluble in water, not injured by smoke.

Amatite is easy to lay. No skilled labor is required. You simply unroll it on the roof, and nail it down with nails which we supply to you. Cement the laps with the adhesive cement which we also supply free packed in the center of the roll.

Amatite costs no more than the kind of roofings that require constant painting. You get twice as much weight of roofing for your money as you do with other roofings.

Sample free on request. Address nearest office.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for roofings and all exposed iron and wood.

Creonoid *Lice Destroyer and Cow Spray*

Spray the hen house regularly with Creonoid to kill disease germs, repel insects, suppress odors and prevent the spread of contagion. Sprayed on cattle it keeps the flies away, and the cows thus protected produce more milk.

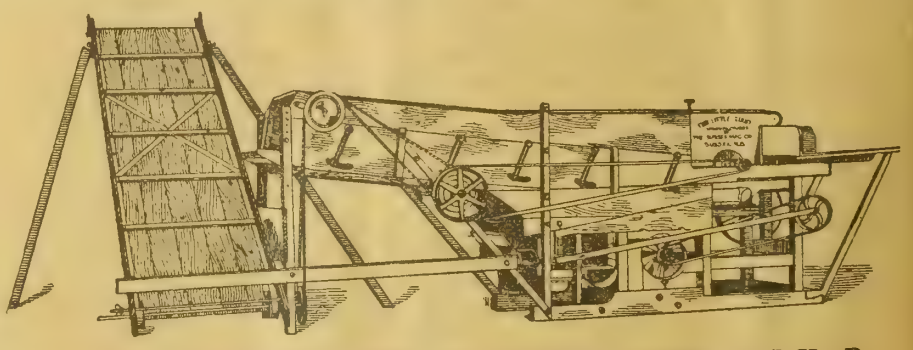
The Best Judge of a Thresher
Is the Man Who Has Used it.

It's not the purpose of this advertisement to tell in detail the merits of the Sussex Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Should any reader wish a detailed description we will mail descriptive catalogue on application.



Four Horse Thresher may be operated with 5 to 7 H. P. Gasoline Engine.

THE SUSSEX MANUFACTURING CO., Sussex, N. B.

DEAR SIRS:—It affords me much pleasure to write that the Threshing Outfit purchased from you has given entire satisfaction. The nearest estimate I can give as to the number of bushels threshed is 60 bush. of oats in one hour. I find that the Sussex Little Giant Threshing Machine is far ahead of any other threshing machine I have ever used. I remain, Respectfully yours, E. F. CRABB, Greenwich Hill.

We manufacture the celebrated Little Giant Threshing Machines—the best on the market—in one, two and four horse sizes. It can be supplied with both bagger and tailings elevator, or with either one, at a slight additional cost. Centrally located, as we are in Sussex, we are within easy reach of all parts of the Maritime Provinces and can cater to your wants better than any other Canadian or American firm.

Also in stock—two second hand two-horse Little Giant Threshers, and two two-horse tread powers, slightly used. Also two second hand four-horse machines, slightly used. These machines were taken to be replaced by larger machines, and will be sold at a bargain.

Send for cuts, descriptions, prices and full particulars to-day. All inquiries receive our careful and prompt attention.

THE SUSSEX MANUFACTURING CO., Ltd., Sussex, N. B.

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for St. John, N. B., Deep Water Wharfs," will be received at this office until 4 00 P. M., on Wednesday, September 20, 1911, for the construction of a series of Wharfs in the Harbour of St John, at St. John West, N. B.

Plans, specification and forms of contract can be seen and forms of tender obtained at this Department and at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N.B., Geoffrey Stead, Esq., District Engineer, Chatham, N. B., A. R. Decary Esq., District Engineer, Post Office, Quebec, J. L. Michaud, Esq., District Engineer, Montreal, J. G. Sing, Esq., District Engineer, Confederation Life Building, Toronto, and H. J. Lamb, Esq., District Engineer, London, Ont.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and places of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered back, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 26, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

---

ing grease the part, and twenty-four hours after that wash off and grease again, then leave alone until the scab heals off and repeat, if necessary. Keep the head tied in a way to keep the mouth and nose from the blister for first forty-eight hours. The wasting of the muscles of the hip is not serious. They will fill up again when free use of the part takes place. A blister is sometines beneficial after four or five days' treatment with the liniment and before suppuration takes place.—J. Standish, V. S.

A large number of active men and boys are required to gather the fruit crop in the Annapolis Valley. Mr. J. S. Lamont, Billtown, Kings Co., N. S., is advertising in this issue for two men. Why go West when there is a harvest to clean nearer home.

Naval Disease.

Naval disease of calves resembles that of naval disease in colts. It is due to a germ which affects the naval cord at birth.

The first symptoms of this disease are noticed by heat and swelling of the naval cord. The germs enter the body at the naval cord and are carried to different parts of the body, usully affecting the joints, such as the hock, knee, ankle or stifle. The joints become hot, inflamed and exceedingly painful. The animal then becomes lame and as the joints become larger pus forms and unless proper care, treatment and attention be given, the animal absorbs the pus and contracts blood poisoning and death soon follows.

It is for these reason that it is very important to thoroughly disinfect a box stall, then place plenty of good clean bedding in it before the animal is turned in to give birth to its young.

At birth the naval cord should be tied with a string or tape dipped in an antiseptic solution, and naval cord should be thoroughly saturated with the solution. This will prevent the cord from becoming infected and also prevent the germs from entering the body of the young animal which they are otherwise apt to do.

"Mr. Farmer, if some steel shingles are as leaky as the guarantee behind them, they're not worth the cost of labor in laying them. Stick to 'The Eastlake.' "—
The Philosopher of Metal Town.

You can build cheaper than ever before—you can make your farm buildings weather proof for all time with —

"METALLIC"

Lumber is of inferior quality now-a-days. Why pay high prices for it when you can cover your buildings with "Metallic"?

Galvanized sheet steel is the most desirable building material known, and "Metallic" is the heaviest and toughest made.

By actual test "Metallic" has proved itself the best material for roofing and siding. Roofs covered with "Eastlake" Metallic Shingles 25 years ago are in perfect condition to-day—absolutely lightning, wind, rain, snow and rust proof.

Look over this list, check the items that interest you, clip list and mail, with your name and address to us. We will give you valuable information that will save you money.

"EASTLAKE" METALLIC SHINGLES—for all buildings.
"METALLIC" ROCK FACED STONE OR BRICK SIDING—makes an artistic house.
"METALLIC" CEILINGS AND WALLS—most sanitary interior decoration.
"MANITOBA" STEEL SIDING—for grain elevators.
CORRUGATED IRON—for barns, implement sheds and stock buildings.
"Metallic" Granary Lining—easy to lay. Protects the grain from rats, mice and other vermin.

On receipt of your name we will mail you our interesting illustrated booklets, "Eastlake Metallic Shingles" and "Interior Decoration in Metal." Write to-day.

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education
It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, Nova Scotia

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course begins NOVEMBER 1st, 1911.

Next Short Course for Farmers and Farmers' Sons begins JANUARY 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 2nd, 1912.

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have not had an opportunity to acquire a high school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

making of cereals into hay is the time of cutting. The best time to cut is just when the grain is in the early milk stage, at which time the stems and leaves may be cured into bright hay of very good quality and reasonably free from dust. If cut too green, the cereal grasses contain so much sap that they are very hard to dry, and require a great deal of air and sun, and even then it is hard to get the forage cured properly, so that it is free from dust. If left until too far advanced toward maturity, the fibre in the plants increases so fast that the digestibility of the dry roughage is very materially lowered. As the plant matures, the large amount of amide nitrogen gradually decreases, while the more valuable albuminoid substances increase. The perecntage of proteid material is greatest in the young plant, but there is a stage in the plant's growth where the fibre increases rapidly, thus decreasing the of digestible nutrients are found to centage of this substance, while the percentage of proteid material decreases, but some of the amides are changed to digestible albuminoids. From practice and analyses, it has been found that the greatest amount of digestible nutrients are ,ound to be present when the grain is just beginning to fill or in the early milk stage. A portion of a field of grain that has been badly lodged by a heavy storm, or by land overrich in nitrogen, causing a soft straw, might quite properly be used for this purpose, because crops, under such conditions, usually give a poor yield of grain.

The cereals are used quite extensively for hay in the states bordering on the Pacific Coast, and the speed of the light horses and the endurance of the work horses of these regions is often attributed to this fact. It has been known that, where horses have been sent from this district to races on the eastern tracks, a supply of cereal roughage has been sent with them, which testifies to the value placed on this kind of feed by those who have tried it.

If it is cut at the proper time, and is well cured, it will compare very favorably with clover and timothy, two of the common crops used for hay in Canada. Timothy hay contains about 2.8 per cent. digestible crude protein, 42.2 per cent. digestible carbohydrates and 1.3 per cent. digestible fat, and clover hay about 7.1 per cent. digestible crude protein, 37.8 per cent. digestible carbohydrates, and 1.8 per cent. of digestible fat; while good oat hay should contain about 4.7 of digestible crude protein, 36.7 per cent digestible carbohydrates and 1.7 per cent of digestible fat. It will be seen by the foregoing that the oat hay is much richer in protein than the timothy and, while not so rich as clover, it would contain a higher percentage than a mixture of clover and timothy, which is quite a common hay mixture in this country. In digestible carbohydrates there is very little difference in the three and in fact they are very much alike, so it is seen that oat hay if properly cured, is one of the best of roughages, and, where conditions are such as to cause a shortage of hay, this crop can be used to good advantage for this purpose. A por-surgical operation which consists of feehing.—Farmers' Advocate.

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, 22nd September, 1911, for the conveyance of His Majesty's Mails on a proposed Contract for four years, 2 times per week each way between Coles Island and Forks from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office of Coles Island, Forks and Route Offices, and at the Office of the Post Office Inspector at St. John.

G. C. ANDERSON,

Economy in Feeding.

Good pasture is sweet and fragrant. These qualities are deficient in dry foods, they are essential to ensure thorough assimilation and prevent waste of food. Food not fully assimilated sooner or later impairs the health. During about twenty-five years Herbageum has, without failure, efficiently and economically replaced those essential qualities, and its regular use with all classes of animals is advised. The cost per month for each cow, horse, beeve, hog or for about twelve fowls is not over 15c and for sheep and calves not over 5c. per month each. It is manufactured by the Beaver Manufacuring Company, Limited, of Galt, Ontario.

N. S. Agricultural College opens November 1st, 1911.

Short Courses at the Nova Scotia Agricultural College opens January 2nd, 1912.

Retention of the Urine.

It is seldom that cattle are afflicted with retention of the urine, unless paralysis or partial paralysis of the animal sets in.

When a male is thus afflicted the animal cannot be relieved without a surgical operation, which consists of an opening into the urethra, just about six or eight inches beneath the roots of the tail. It is impossible to pass a catheter into the organ of a male owing to a peculiar S-like loop which prevents the instrument from passing into the bladder.

When a cow is afflicted with milk fever, or partial paralysis, the retention of the urine oftentimes causes her intense pain and for this reason it is usually advisable to relieve the animal by passing a female catheter into the urethra which lies on the bottom of the vagina.

The urethra of a cow has also a peculiar blind sack which the catheter is very apt to pass into instead of following the correct channel into the bladder. For this reason great care should be exercised when passing the catheter into a cow, but every cattle owner should familiarize himself with this simple operation, otherwise he may injure a cow in attempting to pass the catheter if he is not familiar with the peculiarity of this little urinary channel.

As soon as the urine is drawn from an ailing cow there are usually symptoms of immediate relief, indicating that the animal has been compelled to absorb a great portion of this harmful secretion—the urine.

Anti-Rheumatic Shoes for Men and Women

THE ROBERT TAYLOR CO., LTD.,

HALIFAX, N. S.

The PUBLISHER'S DESK.

Splendid Amusement Features for the Exhibition.

The Provincial Exhibition will open its gates on August 30th, and the big Fair will continue until September 7th. The Amusements will be on a grand scale. A notable feature will be the daily Airship flights by a great expert in navigation in the Upper Regions. Not only in this respect will the amusement features of the forthcoming exhibition be on a splendid scale, but the Commission have also secured seven startling Vaudeville acts which ahall be given in front of the Grand Stand, Afternoon and Evening. The early dates at which the Exhibition is being held this year will make the open-air performances far more enjoyable than they hitherto have been and the Grand Stand will probably draw immense crowds

The horse races which will take place every day of the show will be far more interesting than before. There will be our own speedy horses and to add interest a good representation of American horse flesh. The List of Entries shows that the races will draw the very best horses in the Provinces, and lovers of horses "and who does not love a horse?" will have everything they could desire.

The regular features of the Exhibition will be on a first class scale. Nothing will be neglected. The Fisheries exhibit, for instance, will far surpass anything ever seen in the building devoted to that great industry. The rates of transportation to Halifax will, as usual be very low. Visitors who contemplate going to the Exhibition at Halifax this year will make no mistake in carrying out their intention.

The Prince Edward Island Provincial Exhibition.

The Prince Edward Island Provincial Exhibition will be held in Charlottetown on September 26 to 29th., inclusive. An attractive prize list has been provided and prospects are good for a large entry in the respective classes. If you have not already received a copy of the prize list, do so at once, you will find it will interest you. Look over the list and see if there are not some sections in which you can exhibit. Some livestock, farm produce or some other exhibit then make your entry and thus give your exhibition the moral support that it deserves September is an ideal month for visiting the Island province. Plan to visit the Charlottetown Exhibition this fall. We know you will be well pleased.

New Brunswick Fruit Exhibition.

The big annual New Brunswick Fruit Show will be held in St. John N. B. on October 30th and 31st and November 1st and 2nd. This fruit show will be held under the auspices of the New Brunswick Fruit Growers' Association. Every Farmer in the province of New Brunswick who is interested in fruit growing should become a member of the association. The membership fee is only one dollar and the privileges afforded to members are as follows —

1. Twelve free entries at the Exhibition to be held in St. John the first week in November.
2. Extra entries over twelve at the rate of ten cents each.
3. Free admittance to the three days series of lectures and demonstrations on fruit growing given by experts at the Exhibition.
4. All the horticultural publications issued by the New Brunswick Department of Agriculture and the Association.

If you have not already received a copy of the prize list send for one to the Secretary of the Association, Mr. A. G. Turvey, Fredericton, N. B. Look over the list of commodities for which prizes are offered and see if there are not some sections in which you can make entries and thus help to make the 1911 Fair the best ever held in New Brunswick. Entries close on October 21st.

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General will be received at Ottawa until Noon, on Friday, 22nd September, 1911, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, 3 times per week each way, between Butternut Ridge and Thornbrook from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office of Butternut Ridge, Lower Ridge and Thornbrook, and at the Office of the Post Office Inspector at St. John.

G. C. ANDERSON,
Superintendent.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

REMEMBER! Reeves Munroe, Consulting Electrical Engineer, Taymouth, N. B.

FOR SALE.

25 Yearling Hens of the following varieties :—Rose and Single Comb, R. I. Reds and Brown Leghorns at $1 each.

W. H. HENRY, Shubenacadie, N. S.

P. E. I. Crop Report.

JAS. PLATTS, LOT FIVE writes:—We are having plenty rain now. Grain is not going to give as satisfactory a yield as was supposed two or three weeks ago. The season has been so hot that the grain ripened prematurely. Very little of the grain has been in the ground over three months and recent storms have broken it badly. Potatoes promise a good yield.

MARKETS.

St. John Prices.

GRAIN.—Oats, 50c to 55c.

FEEDSTUFFS.—Corn meal, $3.40 to $3.50.

DRESSED MEATS.—Country beef, 6c to 8c; beef (carcass), 11c to 12c; beef (retail), 12c to 20c; mutton, 6c to 8c; lamb, 12c to 13c; pork, 9c to 9½c.

HORSES.—Drafters, $200.00 to $225.00; carriage, $200.00 to $225.00.

DAIRY PRODUCTS.—Creamery butter, 24c to 26c; dairy butter, 20c to 24c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 25c to 35c doz.; fowl, $1.00 to $1.25; chickens, 80c to $1.25; ducks, $1.00 to $1.25; turkeys, 18c to 20c per lb.

FRUIT.—Apples, $1.50 to $2.00 per barrel; pears, $2.50 to $3.00 barrel; plums, 70c to 75c basket; raspberries, $1.00 six quart pail; honey, $1.25.

VEGETABLES.—Carrots, 50c dozen bunches; potatoes, 85c bushel; turnips, 60c to 80c.

MISCELLANEONS.—Hay, $9.00 to 11.00; straw, $6.00 ton; wool, 14c to 22c; beef hides, 11c; calf skins, 17c; sheep skins, 20c to 40c; lamb skins, 20c to 40c.

The St. John markets are poorly supplied this week. Pork is on the move and the people and traders snap it up at good prices. Lamb is in demand. The beef market is dull and Ontario beef is taking the preference. There are two concerns handling beef, lamb and pork products and they are doing a good trade. The river counties send a great deal of country produce to this market and there is a ready demand for it all.

Charlottetown Prices

GRAIN.—Oats, white, 40c to 45c; black, 48c 52c.

FEEDSTUFF.—Retail $1.30 to $1.35; Shorts, $1.40 to $1.50; middlings $1.45 to $1.50; oil-cake, $2.25 to $2.50; Corn meal, $1.80 te $1 85.

LIVE STOCK—Butchers cattle, 4c to 5c; stockers, $18 to $35; milch cows, $30 to $60; sheep, 4c to 4½c; lambs, 5½ to 5¾.

DRESSED MEATS.—Beef (carcass), 8½c to 9½c; beef (retail), 9c to 16c; mutton, 10c to 14c; veal (carcass), 4¾c to 5½c; lamb, (retail), 12c to 15c.

HORSES.—Drafters, $150 to $225; roadsters, $150 to $225; carriage, $150 to $225.

DAIRY PRODUCTS.—Creamery butter, 23½c to 24c solids; dairy butter, 18c to 20c in tubs, 24½ to 25 prints; cheese, 12½ to 13c.

POULTRY AND POULTRY PRODUCTS.—Eggs, 18½c; fowl, 10c to 12c; chickens, 60c to 80c pair; ducks, 80c to $1.00.

FRUIT.—Apples, 15c to 25c per peck.

VEGETABLES—Carrots (retail) 5c per bunch, Potatoes, 50c to 75c per bush.; turnips, 40c per bush.; beets, 5c per bunch.

MISCELLANEOUS.—Hay, $9 to $10 per ton; straw, $5 per ton; wool, 24c per lb.; beef hides, 10½c to 11c per lb.; calf skins, 12c to 15c per lb.; sheep skins, 35c to 40c each; lamb skins, 35c to 45c each.

Trade in farm products as is usual at this season of the year is dull. There is very little offering and what comes on our market is sold in a small retail way and prices have wider range than is usual during shipping season. Oats are about all cleaned up and what few offer are only sufficient to supply local demand and prices are away above a shipping basis. Some small lots of new vegetables are being shipped to outside markets but mostly by the growers and are being forwarded for sale through commission houses and it is difficult for us to give quotations. Eggs are higher, shippers are now paying 18½c full count delivered at Charlottetown and as shrink is heavy as is usual at this season the price is higher than it appears. Butter and cheese are both higher and the former is likely to be scarce as pastures are very dry and the make will in consequence be short. The same applies to cheese and last board was sold at 12⅞. The market is strong and is advancing but p ices are to such a point that a reaction might be expected. Hay is not being offered as the crop was a short one and farmers are not willing to accept prices that are obtainable at present and in consequence no bnsiness is being done. Beef is quite plentiful but the quality is only fair and prices are easy. Lamb is difficult to buy as the market at present will not pay as high as last season and farmers are holding. The harvest is now well underway and a few days more of present condition and it will be practically all saved The root crop despite the dry season looks good particularly so is this true with regard to potatoes although reports to hand say that the roots are small but as there is no sign of blight this will likely be overcome before digging.

Filling the Silo.

The thousands of farmers who this year face the problem of filling the silo for the first time will find valuable suggestions in a bulletin on "Filling the Silo" just issued by the Iowa Agricultural Experiment station. It was wrrtten by Prof. W. J. Kennedy, head of the annual husbandry work of the station, and is based on years of experience with silos and very extensive investigations among feeders. The buiietin answers every possible question that may arise from the time to cut the corn to putting on the top layer in the silo. One edition of the bulletin has already been exhausted and a second is being printed. It may be sucured by writing to the Iowa Experiment station at Ames for it.

Holstein Bull for Sale

We have a pure bred, registered Holstein Bull, 8 months old, for sale. This bull is well grown, thrifty and fit to head any herd. His dam was producing 70 pounds milk per day, two weeks after freshening. She is due to freshen again in September and is still giving from 20 to 25 pounds. His sire produces as uniform a lot of calves as we have ever seen. If you want him write to-day.

W. C. MacLEOD & SONS, "Gold River Farm, Loch Lomond West, N. S.

Shorthorns For Sale.

We have sold eight pure-breds and have a choice lot of roan and reds left, ages from 13 to 26 months. Also a large red bull, 3 years old.

C. C. H. EATON, Canard, N. S.

HATCHED RIGHT?

Look out now for that white, pasty symptom called **White Diarrhea.**

It may occur anytime from the 3rd day to the 4th week of the hatch. Incurable? Not now! We have Conkey's **White Diarrhea Remedy** this season, a new discovery. Saves chicks even badly affected. Better have a package, price 50c. Use it anyway, in the drinking water as a preventive. It's Chick insurance; why lose from 65 to 100 per cent of the hatch?

Maritime Poultry Supply Co., Moncton, N. B.

AGENTS WANTED TO HANDLE THE

Woodpecker Gasoline Engine

in every locality. The Woodpecker has been sold in the Maritime Provinces for 8 years and is acknowledged to be the best engine made. What a user says :

The 6 H. P. Woodpecker engine that I got from you in September, 1908, has given perfect satisfaction, always ready to go in all kinds of weather, just as easy to start with the thermometer 10 below zero, as she is in the middle of summer. I have done as much work with her now as any ordinary farmer would do during his lifetime and still she runs to-day as well as when I got her, the only expense being one contact spring, costing 40c. If I had to buy one to-morrow, I would buy a Woodpecker in preference to any other kind I have seen working. Yours truly, HOWARD RAMSAY.

The first Woodpecker which we sold 8 years ago is running as well to-day as when she was new. We can make immediate deliveries on any sizes as we have two carloads arriving this week, one in Charlottetown, P. E. I., and one in St. John, N. B.

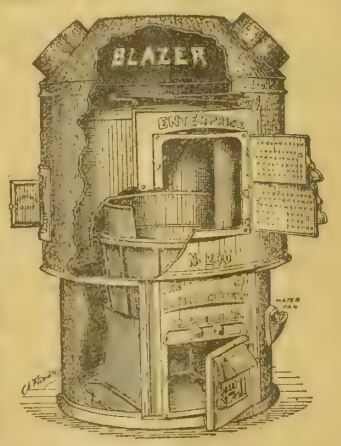
We have a few second-hand engines at different times which we will sell cheap.

Write to-day for descriptive catalogue and prices to

THE L. M. TRASH CO., - - St. John, N. B.

The oldest and largest dealers of gasoline engines in Canada.

Have You to Face the Problem



of how to secure the heat required in this climate for practically seven or eight months of the year, and how to get it in the most satisfactory way, with the least trouble and expense ?

If so, we can help you solve it by supplying a furnace that will fill the bill, the

ENTERPRISE BLAZER

With Patent Fire Pot.

This we have produced after a great deal of study and experience in catering to the furnace trade, and we feel we have in it a heating apparatus embracing all the best features known in the science of heating by Hot Air.

The BLAZER will burn Hard or Soft Coal or Wood, is made in four sizes and of such height as will adapt it for use in low cellars.

In this space we will show in future issues a few of the many testimonials we have received from the far West from those who have found the BLAZER all we claim for it.

Sold by all the leading stove dealers and manufactured only by

The Enterprise Foundry Company,

SACKVILLE, N. B. Manufacturers.

COBEQUID FARM HOLSTEINS !

Offering some fine bull and heifer calves sired by Sir Rooker Posch Artis and Helbon Dekol's Prince, from cows and heifers that are producers. Can spare a cow or two bred to freshen next fall. Inspection solicited.

All our prize winners, with the exception of our herd bulls were bred by ourselves. Write for prices or call and see us. We breed our winners and sell them too.

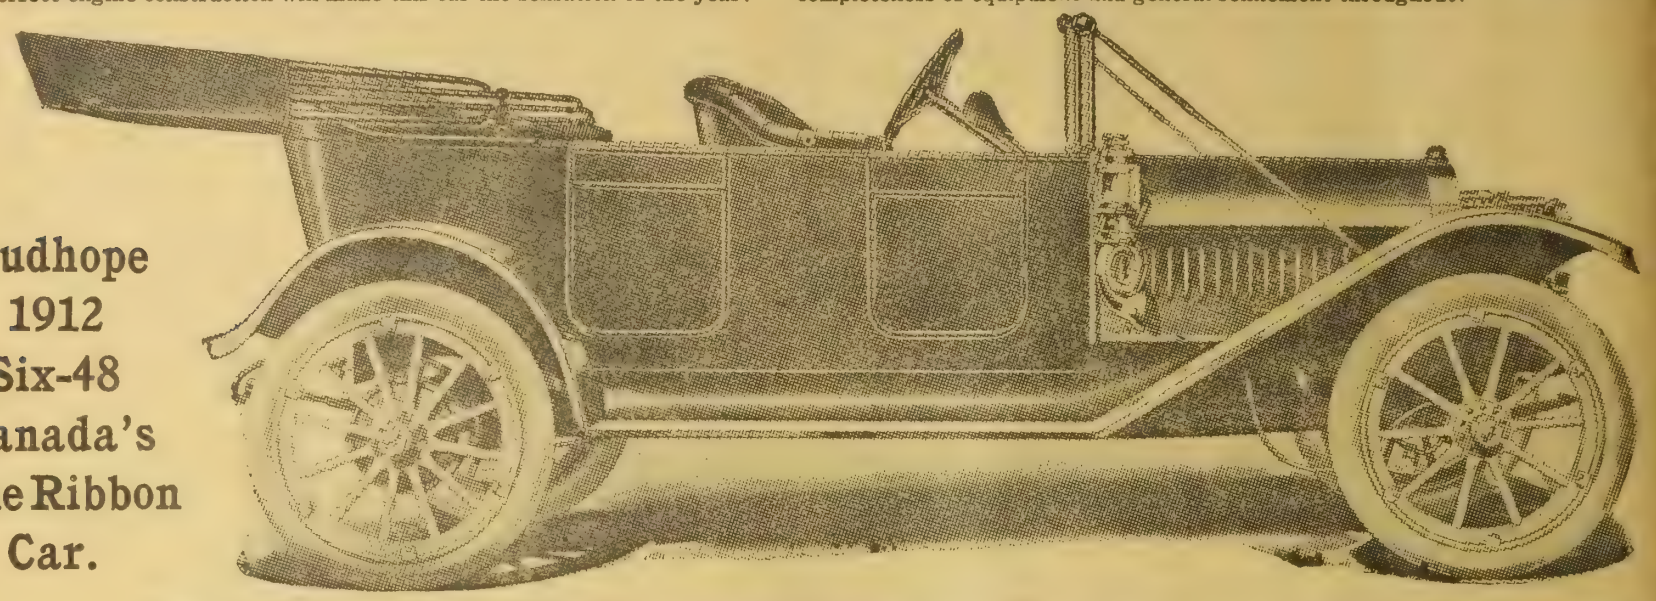
C. A. ARCHIBALD, Proprietor. - - - Truro, N. S.

For 1912 the Tudhopes Announce the Important Addition of a Six-Cylinder 48 H.P. Car to Their Line $2150, Fully Equipped

Here is the car that motordom has been waiting for—a high powered, luxuriously appointed, easy running "Six" at a price within the public's reach. Top and windshield; high class nickel finish throughout; Bosch dual magneto system; continental demountable rims; extra tire and rim; perfect engine construction will make this car the sensation of the year.

The 1911 "Everitt" broke all first season selling records of any Canadian car—due to merit, liberal equipment, confidence in the Tudhope reputation and a knowledge of the wonderful value to motorists of "Tudhope service" which so fully protects "Everitt" owners. The Tudhope 1912 line will surpass the 1911 standard with greater value in tire equipment, completeness of equipment and general refinement throughout.

Tudhope 1912 Six-48 Canada's Blue Ribbon Car.



The 1912 Tudhope Six-48; Nickel Trimmings, Fully Equipped, Two Years' Guarantee, $2,150.

THE Tudhope "Six-48" is the answer to your problem, "How can I enjoy to the full the admitted delights of six-cylinder car operation at a reasonable price—with a guarantee of minimized tire troubles—with a minimum of service-interruptions—with a realization of the fullest possible protection from the makers?" Here is the Tudhope "Six-48," Canada's Car de Luxe. Note the long, low, graceful clean-cut body lines of the 1912 Tudhope "Six-48." Long wheel base, 126½ inches; large wheels; 37x4½ tires; Continental demountable rims; double-drop frame; low-hung body; high round clearance. Bosch Dual Ignition System with Bosch plugs give high-tension spark from two absolutely independent sources—obviating cranking and ignition troubles. Motor vibration entirely absent owing to unit-cast motor rigidity combined with steady power stream from the six cylinders. Safety device in-sliding-type nickel-steel gears run in hard oil. Speed range on the high gear, 2 to 75 miles per hour. Extreme motor simplicity and perfect accessibility of all parts. Self-oiling power plant. Flush door latches. All parts standardized and replaceable by owner. Aluminum clutch, cone type, gradual take-up. Hand-buffed leather upholstery. Roomy tonneau. Wide rear seats. Tudhope-built bodies. Chassis materials, chrome-nickel steel, nickel-steel, best English steel, aluminum, finest gray iron, and die-cast friction-metal motor bearings. Comes with top in finest English Mohair, improved automatic windshield, NICKEL TRIMMING THROUGHOUT, full light equipment with five lamps and generator, foot and robe rails, high-grade speedmeter, horn, tool box on running board, extra Continental Demountable Rim and extra 37x4½ tire complete with cover, holder, etc., comprising items of "Special Tudhope Equipment 1912," extraordinary and sensational. Sold complete, no extras. Guarantee 2 years, with "Tudhope Service."

Continental Demountable Rim and Bosch Dual Magneto. What They Mean.

If no other improvement in our 1912 line were made than the Continental demountable rim and larger tires, this feature would alone place the Tudhope models first among cars for your consideration.

The larger tires prevent excessive wear and the troubles due to possible overload with full complement of passengers. Practically every other car on the market is undertired. The Tudhope policy is to give a wide margin of safety by tires of the most liberal size.

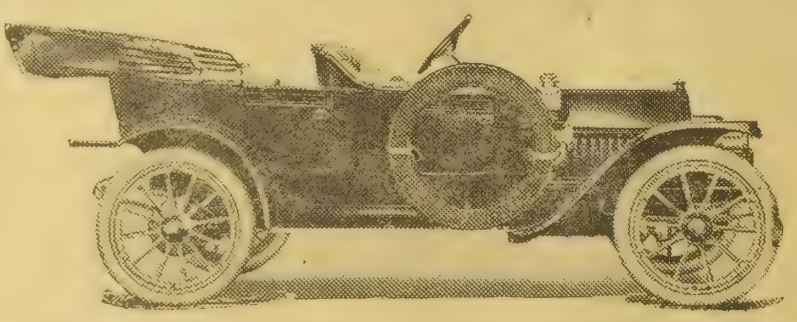
The extra Continental demountable rim carried with extra tire ready inflated, permits the change of both tire and rim, in case of tire trouble, with only a few moments' work.

The Bosch Dual Magneto—which must not be confused with "duplex" systems in the market—makes the Tudhope driver independent of ignition troubles. Has two independent sources of current—magneto and battery—either may be used at need. The most luxurious cars are equipped with Bosch Dual Ignition.

These adjuncts are costly for us to add to the moderate-priced Tudhope cars. But they give value and assurance of road service to our customess.

Tudhope Service—Vastly Importans to First Car Owners.

Behind each "Everit" sale is the policy of Tudhope protection to the owner. We prepare for our responsibility in the factory. It begins when we sell. We safeguard our cars to actually deliver to the owner all he expects. Our 2 years' guarantee is just twelve times the length of the usual motor car guaranteed.



Model C, Fore-Door, 1912 4 Cylinder Model, Completely Equpped, $1,625.

SPECIFICATIONS.—Large wheels, 35x4 tires, Continental demountable rims, double-drop frame, Bosch dual ignition, which permits starting from the seat, and Bosch spark plugs. Unit-cast, long-stroke, four-cylinder, 30-36 h. p. motor of increased efficiency, self-oiling and accessible in every part. Safety, selective nickel-steel transmission gears running in oil. Wide tonneau, hand-buffed leather upholsterd and Tudhope-built bodies and finishing. HIGH-CLASS NICKEL FINISH throughout. Aluminum clutch, high road clearance, low-hung body. Has best English mohair top, heavily-nickeled windshield, extra Continental demountable rim and extra 35x4 mounted tire with cover and holders. Horn, full light equipment, including five lamps (nickeled), generator, foot and robe rails, high-grade speedometer, tool box on running board, "Tudhope Special Equipment 1912," 2 years, guarantee, and "Tudhope Service" for owner's protection. Car sold complete as above—no extras to buy.

Tudhope Motor Co., Limited,

ORILLIA, - ONTARIO.

(All Prices F. O. B. Orillia.)

Tudhope Reputation and Perfect Factory Facilities Behind Every Car They Sell.

The Tudhope factory is fully equipped with jigs and fixtures for wholly producing Tudhope cars in absolutely interchangeable parts. The jigs hold the unfinished parts and also guide the tools working upon them to an absolutely exact position. This ensures hair-breadth accuracy of parts. The work of the jigs, and all machines, is further corrected by ceaseless inspections and gaugings, which discard parts showing flaws or variations of more than 1-1000 inch from standard measurements. The result is an accurately assembled and well-fitting chassis which cannot develop lost motion under road vibration.

All this gives Tudhope cars many years of life, and prevents many breakages of parts. It enables great value to be offered at moderate price by lowering the cost and facilitating the production of fine-fitting parts.

Tudhope cars are built to deliver SERVICE to owners.

Come early. Stay as long as you like. You will be welcome and if you don't have a good time it won't be the fault of the

FREDERICTON EXHIBITION.

What about the Boy Who is to Become a Farmer ?

Give Him an Agricultural Education

It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology, Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

Agricultural College, Truro, Nova Scotia

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course begins NOVEMBER 1st, 1911.

Next Short Course for Farmers and Farmers' Sons begins JANUARY 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies begins JANUARY 2nd, 1912.

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Sciences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have not had an opportunity to acquire a high school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Agricultural Colleges. For full particulars apply to—

M. CUMMING, B. A., B. S. A., - Principal Agricultural College, - Truro, N. S.

The Farm Labor Problem

The two great problems on the farm to-day are time and labor, especially at this time of year when you are gathering in your crops and preparing for the winter months. Wouldn't you welcome a machine that could work away all day, doing your tedious jobs, such as running a cream separator, threshing, cutting corn or pumping water and sawing wood. This is what a

FAIRBANKS-MORSE GASOLINE ENGINE

will do for you being built for such service and has proved this to over 112,000 users, affording them cheap and reliable help at all times, and any season. Our engines for out-door work are made to run in the coldest day as well as the hottest. Take up your pencil and fill in the coupon and mail it to The Canadian Fairbanks-Morse Co., Limited, 444 St James St.

THE MARITIME FARMER
AND
CO-OPERATIVE DAIRYMAN.

Official Organ of The Farmers' and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association and The Maritime Bee-Keepers' Association.

Volume 16. Sussex, N. B., Sept. 12, 1911. Number 23.

The Nova Scotia Provincial Exhibition.

THE Nova Scotia Provincial Exhibition, the first show in the 1911 series of Maritime fall fairs, was held at Halifax, N. S., on August 30th to September 7th, inclusive. The weather man favored the show with warm, sunny days and at night the harvest moon shed her soft light on place and people.

THE ATTENDANCE.

The attendance was fair. Monday, September 4th, being a public holiday brought a large number of visitors to the fair grounds. On that day the turnstiles clicked and clicked all day until at night they had registered upwards of 18,000 paid admissions. The grand stand and its paddocks were crowded to overflowing and the management was compelled to throw open the gates leading to the race track and thus allow the visitors the comforts of standing seats on the infield.

THE ATTRACTIONS.

The racing was excitable. Every heat was a race for the money and there were many close finishes. The stage attractions, between the heats were clean, and the various acts were cleverly performed. The airship ascensions were witnessed with keen interest as the bird man soared hither and thither, at various altitudes over the grounds.

THE ADMINISTRATION OFFICE

were as usual under the careful direction of manager, M. McF. Hall, who with his genial assistants, Miss DeWolfe and Messrs. Ross and Gass, made matters as pleasant for visitors and exhibitors as they possibly could.

THE WOMEN'S BUILDING

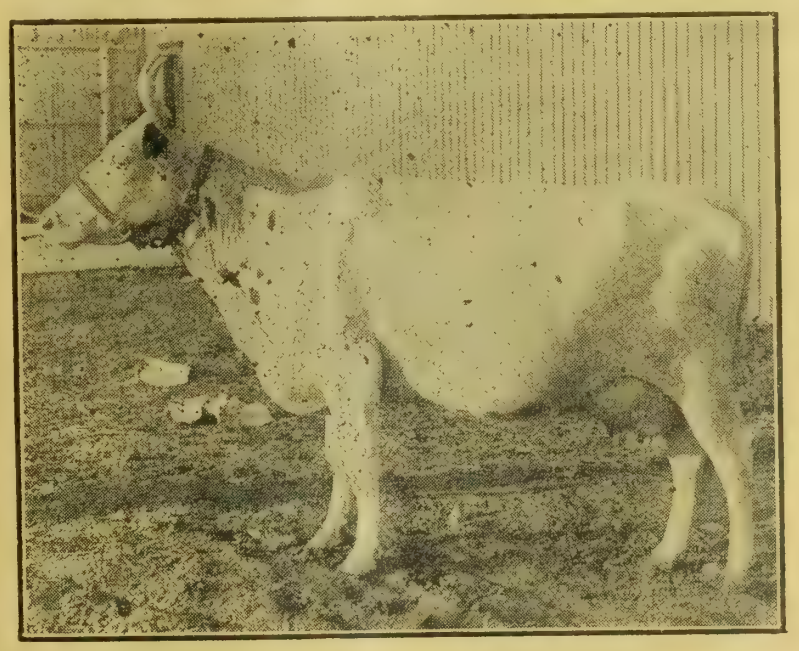
contained many and various specimens of women's work. There were preserved fruits, breads, cakes, candies, home-made textiles of wool and linen, home-made mats, rugs and quilts, knitted, crochet, needle embroidery, laces and drawn work, as well as decorative and other industrial articles. The exhibits showed by tasty appearance and workmanship what the hearty co-operation of brain and hand alone can produce.

THE ART GALLERY

contained many beautiful paintings, but taken as a whole it did not come up to as high a standard as it did in 1910, either in point of quantity or quality.

THE MINES BUILDING

contained displays of the minerals of the province in both the raw and manufactured states. The various exhibits were very attractively arranged and reflected much credit on the industrial giants of Nova Scotia.



Culcaigrie "White Lady" (27660)
Champion Ayrshire Female at the Halifax Exhibition. Owned by McIntyre Bros, Sussex, N. B.

THE FISHERIES BUILDING.

The exhibits in the fisheries building were also attractively displayed and were more numerous than ever before. There were more exhibits by individual fishermen than has been the custom in the past. The products of the deep, as put up for human consumption by those who go down to the sea in ships, are a great source of reaenue to the people of sea coast towns. The display they made this year was one of which fishermen, packers, cannees and cold storage men might well feel proud.

MACHINERY HALL

was not so well filled as on other occasions. The principal exhibits were carriages, wagons, spraymotors, automobiles and milling machinery.

THE MAIN BUILDING.

Nearly every available foot of space in the main building and annex were filled with the neatly arranged booths of manufacturers and dealers; a prominent featdre being the "Made in Halifax" exhibits.

AGRICULTURAL HALL.

The exhibits in Agricultural Hall, owing to the dryness of the past season and the earliness of the exhibition dates, did not come up to the standard of other years in either quality or quantity. The Nappan Experimental Farm had an attractive array of the products of the farm that drew the attendtion of each and every visitor. George B. McGill placed the awards.

THE BUTTER AND CHEESE

was judged by Mr. C. W. McDougall, Dairy Superintendent, Sussex, N. B. The classes were fairly well filled but the quality of a few of the entries was not what it might have been. The score ranged from 96.75 points down to a low scale in the standard. A full list of prize winners will be found on another page of this issue.

APIARY PRODUCTS

were nearly down to the vanishing point. Chas. Piers, of Dutch Village, N. S., alone saved the reputation of the honey bee. The season of 1911 has not been a favorable one for the production of honey in the Maritime Provinces.

HORTICULTURAL HALL.

Owing to the immature condition of fruit at so early a date and in deference to the special request of the Nova Scotia Fruit Growers' Association, fruit was not catalogued in this year's prize list. Consequently not a solitary specimen of fruit was shown. The Horticultural Hall contained an abundance of potted plants and cut flowers but did not present as admirable spectacle as fruit of various kinds would have made.

LINE STOCK ENTRIES.

The comparative number of live stock entries at the 1910 and 1911 Halifax exhibitions were as follows:

HORSES.

	1910	1911
Roadsters	14	40
Carriage	17	9
Ponies	5	7

Yorkshires	23	29
Poland China	8	10
Duroc Jerseys	8	9
Fat Pigs	6	14

THE HORSES

were as usual under the careful supervision of Mr. W. W. Black and Mr. J. W. Cowie, of Ontario placed the awards, with the utmost acceptance to spectators and exhibitors.

THOROUGHBREDS.—W. A. Black, of Halifax, showed Haphazard in the aged stallion class. Wm. Robertson, Halifax, had Ben Cotton by Lucifer II., dam Bennetta Cotton in the one-year-old stallion class. Burnetta owned by Mr. Robertson was the only Thoroughbred mare with foal by her side. Bernetta is by Joe Colton, dam Alanta. Salome a two-year-old filly by Lucifer II., dam Silence was also shown by Mr. Robertson. Haphaszard and Bernetta Cotton were champions in their respective sections.

STANDARD BREDS.—The Standard Bred Classes were well filled. Competition was keen and the respective owners were out to win. R. S. Starr's Royal Knight captured the red ribbon. Thos. Munro. with Maritime Prince, by Eastern Prince, captured the blue, while King Dodds, by Kalole, the champion at the 1910 and 1211 Amherst Horse shows went down to third place. Blake Bros. had no competition with Canadian Prince by Isle Dew in the three-year-old stallion class.

In the two-year-old stallion class Robert H. Gray led the way with Baron Britt by Baron Posey while Thos. Munroe took second money with Darkie by Achille.

The one-year-old stallion class had five entries. Frank Boutillier mounted to the head of the list with Mac Baring by Baring out of Jessie Rampart. While G. L. Sellets captured second place with Bocasso by Achille out of Lena Brazillian. Mrs. W. H. Musgraves' Baring Comet by Baring out of Karava came in for the third award.

There were four entries in the place for brood mare with foal. G. A. Polley's Muriel P., by Marico out of Vendetta topped the list. S. E. McGregor's Ruritania by Bow Bell captured the blue ribbon, while E. J. McKenna with Lilla Lee by Alright came in for the third award. G. L. Sellers with Lena Brazilian by Brazilian, out of Mistake, and D. L. Bell with Annie Mayflower by Tom Medium, out of Rock Farm Beauty contested for honors in the four year olds and upwards, filly class. The honor of first place was captured by Lena Brazilian.

Dwyer's Ima Jewle by Brazilian out of a Perceptor dam had no competition in the three-year-old filly class and won the coveted championship for best brood mare, any age.

Countess Bird, by Baron Posey and Olive Berry by Baring, captured first and second places respectively, in the two-year-old filly class.

S. E. McGregor's Retania, out of the second prize brood mare Ruritania led the 1911 foal class with Marico the Great, by Marico, out of Muriel P., and Lilla Lee's foal by Marshall M., in second and third places.

ROADSTERS were also out in strong and every improving numbers. There were six entries in the class for brood mares with foals by their side. Queen Bess by Frank Patch, Jessie Lew by Cragg Piolet out of a Rampart mare, and Dora Achille by Achille out of a Fleetfoot mare, with her foal by Fair Oaks won out in order named.

An Achille colt, dam Quashia, won the coveted red in the three year old filly gelding class, while Frank S. by Sabledom, out of Gracie Rampart, and Lulu M., by Corn Cracker captured the white and blue ribbons respectively.

The two-year-old section had seven entries. The winners were Silver Heels by Marshall M., out of Jennie L.; May Blossom by the Surveyor out of Bronze Jenny and See-Me-Go by Royal Pandect.

In the one-year-old section Harry Jennie Rere the only contestants and Cora by Surveyor out of Bronze by Border, out of Lilla Lee and Cola won out in their respective order.

Marico and Baring foals came in for first and second places in a class of seven good ones and Jennie Lew, the second prize brood mare's foal, stood in third place.

W. W. Black's Violet and Dignity had no competition in the class for pair matched roadsters.

There were thirteen entries in the class for single horses in harness. Rosy Bell by Border, dam by Rampart, Fitzsimmons by Earl Simmons and Dina by Maritime Prince were the successful ones in the order named.

CARRIAGE HORSES.—There was very little competition in the Carriage Horse Class. C. A. Sellers had Foxy Fleetwood and her foal by Fair Oaks at the top of the list in the brood mare and foal of 1911 classes.

Daisy Lucifer by Lucifer II. had no competition in the three-year-old filly class. Sabledom and Administrator colts stood in first and second places in the single horse, in harness section.

PONIES were a small class. The list of awards will be found elsewhere in this issue.

GENERAL PURPOSE HORSES.—The General Purpose horses made up in quality what they lacked in numbers. The entries numbered twenty, an advance of six over last year's entries. The four-year-old and three year-old sections were led by G. B. O'Brien's mares by Performer. In the latter class, a Merry Monarch colt came in for second money. Merry Monarch colts were also at the head of the two and one year old classes, and Scamp came in for third money. The first prize brood mare in this class was by Full of Fashion.

The 1911 foals were by Baron Frederic, Sunrise and Merry Monarch and were placed by the judge in the above order.

Harry McKenzie, Shubenacadie, showed a splendid matched team by Cordigan and Full of Fashion.

HEAVY DRAUGHT HORSES—The heavy draught horse class is steadily improving in numbers and quality, thanks to the progressiveness of those horse men who have purchased and maintain first class sires of this type. The most phenomenal winning in this class was made by Sharpe & McNeil, of Windsor, with a beautifully turned mare by Merry Monarch and four of her offspring by Baron Frederic, that were good enough to win the highest award in each and every section of the class in which they were exhibited. Performer and Full of Fashion Fillies captured first and second places in the four-year-old and upwards class. A Performer filly was second in the two-year-old class. Baron Frederic and Pride of Windham foals captured all the money in the one-year-old class. A Pride of Windham foal stood second in the class for 1911 foals.

Geo. B. O'Brien and W. W. Black were the only competitors in the matched team section. The red ribbon went to O'Brien's Performer mares.

CLYDESDALES—There were five entries in the aged stallion section of the Clydesdale class. R. S. Starr's Baron Primrose by McEchran, led the way by capturing the red ribbon and diploma, as well as the Silver Cup donated by the Dominion Clydesdale Association, for the best stallion, any age, and for best stallion and three of his get. Sharpe & McNeil's Baron Frederic by Baron Pride and Geo. B. O'Brien's Norseman came in for second and third money. Baron Frederic was a close competitor with three of his get, for the diploma.

Petrucios Heir by Pretucio, imported from Scotland last fall by the late A. H. Thomson and now owned by H. Purdy & Sons, Wentworth Station. captured the red ribbon in the three-year-old stallion class. A Flash Favorite colt stood in second place.

R. S. Starr, H. W. Corning and Lee & Clark had the only entries in the two-year-old stallian class and won in their respective order with Baron Prince, by Baron Primrose, Baron Corning by Baron Graham by Baron Primrose and Labori Again by Handy Andy.

Mr. W. W. Black's County Beauty and her foal by Saxon Prince were the only entries in the brood mare and foal sections respectively.

Black's Miss McKay had no competition in the four-year-old filly class.

The three-year-old filly class brought out four good ones. R. S. Starr's Berfern Favor by Royal Favorite; O'Brien's, Queen of Troy by Baron Frederic and Amherst Girl by Prince Albert won, first, second and third places respectively. The championship diploma for best mare, any age, was captured by Berfern Favor.

There were also four entries in the two-year-old filly class. The prize winners were: Lady Primrose by Baron Primrose; Hampstead Rose by Handy Andy and Daisy Bell by Pride of Windham owned by E. S. Starr, W. W. Black and Stewart Etter, respectively.

A Pride of Windham filly had no competition in the one-year-old filly class.

R. S. Starr captured the Silver Cup, offered by the Queen Hotel for the best five horses, any breed, owned by the exhibitor, with Baron Primrose, Berfern Favor, Lady Primrose, Baron Prince and Queen.

PERCHERONS were few in numbers. Three stallions and one mare and a foal of 1911 made up the class. W. A. McManus' Massall by Chavilier, Samuel Dickie & Son's Immerseif by Polka and Chas. Symes' Lord Roberts by Marso had everything their own way in the aged, three-year-old and two-year-old stallion classes. Immerseif captured the championship diploma. Chas. Symes' Distinguee and her foal of 1911 by Eurbago were the only other entries in the Percherons.

The Silver Medal, donated by the Canadian Hackney Horse Society for best Hackney mare, any age, was won by W. W. Black's Dignity.

BEEF CATTLE.

Mr. Chas. Bailey, of the Ontario Department of Agriculture judged the beef classes.

SHORTHORES.—It took only a few minutes to judge the Shorthorn class as C. A. Archibald was the only exhibitor. He had his stock out in good show shape and was awarded all the prizes.

HEREFORDS—With the exception of a two-year-old bull owned by Geo. B. O'Brien, Windsor, N. S., W. W. Black's well fitted Herefords had no competition. Rupert Ingleside, Black's aged bull, carried off the Championship diploma and Sylvan Famous, shown in the aged cow class carried off the honors for best cow, aoy age.

DEVONS.—Chas. G. Pinkey and Wm. A. Pinkey, of Yarmouth County, divided the Devon honors pretty evenly between them. The male and female championships went to Chas. G. Pinkey's Prairie King and Dawn of Springvale, respective,y. Prairie King was first with three of his get, and Mary's Pride was first with two of her offspring.

GRADE BEEF CATTLE.—With the exception of first prize, on one-year-old steer, which went to E. S. Congdon, all the first prizes in this class went to W. W. Black's Grade Herefords. Geo. B. O'Brien, Victor W. Aylward and Wm. Robertson were the other contestants in the grade beef classes and won prizes as published on another page of this issue.

FAT CATTLE were shown by W. W. Black, E. S. Congdon, C. A. Archibald and Geo. B. O'Brien. Black won 8 first prizes and 2 second prizes. E. S. Congdon had the best pair of fat oxen over 3 years. C. A. Archibald had the best two-year-old heifer.

WORKING OXEN were shown by Chas. A. Tupper, Tupperville, N. S.; E. S. Congdon and Geo. B. O'Brien. Mr. Tupper's oxen, in the four-year-old class, were the best seen on the Halifax grounds for many years. They tipped the scale in vicinity of 4,300 pounds. They were grade Herefords that were pretty evenly matched. Congdon and O'Brien shared honors in the three-year-old, and two year-old sections of the class.

DAIRY CATTLE.

AYRSHIRES were out in full force. McIntyre Bros., and M. H. Parlee, of Sussex, N. B., were on hand with two beautiful herds to vie with their Nova Scotia stock breeding brethren, Messrs. Retson Bros., C. A. Archibald Prescott Blanchard, E. R. Stewart and John McDonald & Sons.

Blanchard's Spicy Sam led the aged bull class and captured the coveted diploma, for best Ayrshire bull, any age. McIntyre Bros.' Sunrise of Whitehill came in for second place in the aged bull class and was followed in third place by Gardrum Prince, owned by Retson Bros.

M. H. Parlee's Morton Main's Amanth, McIntyres' Grange Kelly and a bull owned by John McDonald & Sons strove for the mastery in the two-year-old bull class and were awarded the prize ribbons in their respective order.

McIntyre Bros lead each of the remaining bull classes with Dean of Spring Brook Farm, Sun of Spring Brook Farm and Peter of Spring Brook Farm. Prescott Blanchard had the second best junior yearling bull and John McDonald & Sons the third. Parlee's Maple Grove Romeo was the second prize winner in the senior bull calf class, closely followed in third place by a Retson bull. Retson Bros. won second place in the junior bull calf class and C. A. Archibaldjs Gerta's Pride came in for the third money.

In the aged cow class McIntyre Bros. led the way with Culcaigrie White Lady and Morton Main's Lady Nelly, while Parlee's West Newton Bloomes VII. took the remainder of the cash. Culcragie White Lady carried off the palm for best Ayrshire female, any age and for female and two of her offspring thus maintaining her past show ring records.

McIntyre Bros.' Orange Lily was sandwiched in between Retson Bros.' Clerkland Jenny and Wee Nan in the three-year-old cow class. White Lady II., a daughter of the champion cow headed the two-year-old heifer class, with a Blanchard heifer in second place and Retson Bros.' Bonnie Jean in third position.

Gardrum Snowstorm, a Retson heifer, headed the senior yearling class. Next to her stood Parlee's Maple Grove Violet and further down the list a McIntyre heifer.

McIntyre Bros. captured first and third prizes in the junior yearling and senior calf classes. Blanchard had the second prize heifer in the former class and Parlee's Maple Grove Buelah and Retson's Clerkland Bonshaw captured the remaining prizes in the senior calf class.

A Blanchard heifer walked away with the red ribbon in the junior calf class closely followed in second and third places by McIntyre and McDonald calves.

The chief honors in both aged and young herds went to McIntyre Bros. Retson Bros. had the second best and Blanchard the third aged herd.

Parlee and Archibald captuted the second and third young herd prizes respectively.

Mr. A. Kains, Byron, Ontario, placed the awards.

HOLSTEINS.—Logan Bros., Harding Bros., J. D. Irving and Lea & Clark were the principal Holstein exhibitors. S. Dickie & Sons, who showed so extensively on previous occasions, only showed their aged bull, Sir Rooker Posch Artis, capturing the second prize in a class of six entries.

Logan's Artis Jake led the aged bull class, while Harding's Schuiling Sir Posch, grand champion at Toronto in 1909 and 1910 went down to third place. Many of the spectators thought that Mr. R. S. Stevenson, who placed the awards, would have made no mistake had he placed the Harding bull at the top of the list. J. D. Irving's Lord Albion Main's stood in fourth place.

Artis Jake won the championship diploma and headed the first prize aged herd.

Harding's Sir Mercena Faforit Lad led the two-year old bull class and was closely followed in second and third places by Irving's Togo of the Seaside, and Lea & Clark's Ida Rooker II. Vale.

Lea & Clark's Bob Dorindo, grand champion at St. John in 1910, took second place in the senior yearling bull class to Irving's Sea View Rooker. Lea & Clark had the third prize junior bull calf. Harding Bros. led the senior bull calf class with Sir Jacob Lad. The remaining prizes in the bull calf classes went to Logan Bros.

There were ten entries in the aged cow section of the Holstein class. Piet VI., Logan's champion at St. John in 1910 went down to third place, while Harding's imported cow Blizzard, an extremely classy one, mounted to the head of the list and captured the championship diploma. Lea & Clarke's Jacoba Johanna and Jacoba Emily II. came in for second and fourth monies. Jacoba Johanna was first with two of her offspring.

The three-year-old cow class had eight entries. Lea & Clark's Whilemina Van Voram, Harding's Miss Mercena Faforit and Logan's Jacoba Emily V. and Annie Rooker captured the red, blue, white and green ribbons respectively.

There were seven good two-year-old heifers. Logan's Ida Rooker III, led the way, with Harding's Pauline Posch Lady sandwiched in in third place, between Sea View Lulu and Seaside Marion, two of Irving's good ones.

Harding Bros. again mounted to the head of the list in both the senior and junior yearling heifer classes with Miss Jacoba Faforit and a Sir Mercena Faforit Lad heifer.

Logan Bros. captured the second and third prizes in the senior yearling class, the second prize in the junior yearling class, the first and second prizes in the senior calf class and the first and fourth places in the junior calf class. Lea & Clark had the fourth prize senior yearling heifer the third prize junior yearling and senior calves and the second prize junior calf. J. D. Irving captured the fourth money in the junior yearling class.

Harding Bros. showed the fourth prize senior and the third prize junior calves.

Lea & Clark's Ida Rooker II's Vale was the best bull with three of his get, followed in second and third places by Harding's Sir Mercena Faforit Lad, and Irving's Lord Albion Mains. The first and second and the third prize honors for female and two of her offspring went respectively to Lea & Clark, Harding Bros., and J. D. Irving on Jacoba Johanna, Faforit VII. Beauty, and Minnie Burke.

Logan Bros. won the first prize on aged herd and the first and fourth prizes on young herds. Harding Bros had the second prize winners in both aged and young herds, while Lea & Clarke captured the third award in each case. The fourth prize for aged herd went to J. D. Irving.

GUERNSEYS.—Roper Bros., and H. W. Corning were the two largest exhibitors of Guernseys. Among the smaller exhibitors were Jas. McKenzie and Hugh A. Dickson, Central Onslow, N. S.

Roper Bros.' Golden Opinion had no competition in the aged bull class Corning's Island Prince of Hillside captured the red ribbon in the two-year-old bull class, as well as the championship diploma. McKenzie's Island Prince out of Dolly of Willow, Roper Bros.' champion cow, came in for third money in this class while another Roper bull was sandwiched in in second place.

Roper Bros. had the only senior yearling bull, the first prize junior yearling bull, the second prize senior bull cald and the third prize junior bull calf. John N. Chute had a very nice junior yearling bull that captured second money. Corning captured the third money on senior bull calf with Pansy's Boy and the first and second moneys on junior bull calves with Dairymaid's Prince and Buttercup's Boy. Dickson had the first prize senior bull calf. With the exception of third prize money on junior yearling heifer, which went to J. N. Chute, all the female prizes were won by Roper Bros., and H. W. Corning. Roper Bros. had the first and second prize aged cows, Dolly of the Willows and Dolly of the Villet, the former being the champion female. Corning's Beauty of Hillside won the third prize in this class. A Roper cow was sandwiched in in second place in the three-year-old cow class between Corning's Buttercup and Dairy Queen.

In the two-year-old senior yearling classes the centre of the sandwich was occupied by Corning heifers. hile a Roper heifer took the centre in the senior calf class. Roper Bros. captured first and second positions in both the junior yearling and junior calf classes, followed in the former class by J. N. Chute and in the latter by H. W. Corning. Corning's Island Prince of Hillside was first with three of his get and was his Dairymaid with two of her offspring. Corning nad the best aged herd and the second best young herd. Roper Bros won second and third monies on aged herd and first and third monies on young herd.

Mr. R. Robertson, Nappan, placed the awards and gave the breeders perfect satisfaction.

JERSEYS.—H. S. Pipes & Son, J. E. Baker & Sons, and Josselyn & Young were the principal competitors in tne Jersey class. The herds were out in fine condition and every section was well filled. Josselyn & Young carried off the two championships, the first prize on breeders' young herd, the third prize on young herd and the first prize on cow and two of her offspring. Their champion cow was Flying Fox's Adora and their champion bull was Foxall St. John O'Dreamwold. Pipes' Fereor was first with three of his get. Fereor's get also comprised the greater number of the bulls and heifers in both the first and second prize young herds. J. E. Baker & Sons had the first prize winners in the two-year-old senior yearling and junior yearling bull classes.

Edward Snowden, Amherst, showed Sky Lark, a blue blood heifer, in the junior yearling class and won second money. The other winnings as placed by J. Rufus Starr, the judge, will be found elsewhere in this issue.

The special prize, donated by the Merchants' Bank of Canada, F. M. Scarff, manager, Halifax, N. S., for the best pure herd of dairy cattle, brought out eight strong herds—two Jersey herds, two Guernsey herds one Holstein herd, and three Ayrshire herds. The Silver Service went to McIntyre Bros.' Ayrshires, with Harding Bros.' Holsteins as their closest competitors.

DAIRY GRADES.—Only Nova Scotian exhibitors were allowed to compete in the grades classes. There were some real classy individuals shown in the respective sections. The whole class was a good indication of what may be accomplished by any farmer who sticks to the use of a pure bred sire for a number of years. The full list of awards will be found on another page of this issue.

SHEEP.

The competition in the sheep classes was not so strong as in other years; nor were the flocks as high as we have seen them on previous occasions. Mr. Chas. Bailey placed the awards in the respective classes.

LEICESTERS were shown by A. L. Boswall and S. L. Boswall, of Prince Edward Island, and Retson Bros., of Truro.

COTSWOLDS—H. W. Corning, of Chegoggin, N. S., had everything his own way in the Cotswold class.

LINCOLNS.—All the prizes with the exception of second and third prizes on aged ewes, which went to Chas. Symes, Minudie were won by Boswalls of P. E. Island.

SHROPSHIRES—There was no competition in the Shropshire class. Geo. L. Boswall, P. E. Island, being the only exhibitor, walked off with all the prizes and had come prepared with good specimens to stand some sound opposition.

SOUTH DOWNS.—As in the Shropshire class there was only one exhibitor in the South Down class. J. E. Baker & Sons had a lot of good ones and carried off very creditably, all the red ribbons.

OXFORD DOWNS.—J. E. Baker & Sons the only exhibitors of Oxford Downs.

CHEVIOTS.—Chas. Symes and Henry Leithead had their flocks out in good shape. Symes won all the first prizes with the exception of the first prize on Shearling Ram and on Ram Lamb, which were captured by Mr. Leithead.

DORSETS were out in strong numbers. E. F. Servant, Hartland Poultry Yards and Geo. L. Boswall locked horns and strove for the supremacy. Over sixty per cent of the first prizes went to the Servant flock. The remainder of the winnings will be found in the list of winnings on another page.

SUFFOLKS—The Boswalls showed a nice flock of Suffolks and carried off the prizes without competition.

GRADE SHEEP were shown by H. W. Corning and J. E. Baker & Sons, each capturing all the prizes in the long wool and medium wool classes, respectively.

THE SWINE CLASSES were also judged by Mr. Charles Bailey and the job was neither long nor tedious as there was very little

(Continued on page 845.)

This Iron Age Potato Digger

is easily operated by two horses and will please the most critical in its work. It has many advantages over other makes of Diggers, such as ease in draft and ease to keep on the row, absolutely no bruising of potatoe and dig as many as you like before picking up. The machines of Bateman Mfg. Co. have been on the market for 75 years and are warranted to give satisfaction. Write for catalogue and prices.

C. FRED FAWCETT, - Upper Sackville, N. B.

Long Distance 'Phone. Eastern Representative.

Prize Winners at the 1911 Halifax Exhibition.

HORSES.

THOROUGHBREDS.

Stallion, 4 years or older, 1, W. A. Black, Halifax.
Stallion, 1 year old, 1, Wm. Robertson, Halifax.
Brood mare with foal by her side, 1, Wm. Robertson.
Filly, 2 years old, 1, Wm. Robertson.
Foal of 1911, 1, Wm. Robertson.
Stallion, any age, 1, W. A. Black
Brood mare, 1, any age, Wm Robertson.

STANDARD BREDS.

Stallion, 4 years old, 1, R. S. Starr, Port Williams; 2, Thos. Munro, New Glasgow, N. S.; 3, Dodd Dwyer, Pictou, N. S.
Stallion, 3 years old, 1, Blake Bros., Shubenacadie, N. S
Stallion, 2 years old, 1, Robert H. Gray, Thorburn, N. S.; 2. Thos. Munro; 3. Heber Hartlen.
Stallion, 1 year old, 1, Frank Boutilier, Halifax; 2, G. L. Sellars, Westerley; 3, Mrs. W. H. Musgrave, Halifax.
Brood mare with foal, 1, G. A. Polley, Lunenburg; 2, S. E. McGregor, New Glasgsw; 3, E. J. McKenna, Kingston Station
Filly, 4 years old, 1, G. L. Sellars; 2, D. L. Bell, Shubenacadie.
Filly, 3 years old, 1, Dodd Dwyer.
Filly, 2 years old, 1, Thos. Munro; 2, Frank Boutilier.
Foal of 1911, 1, S. E. McGregor; 2, G. A. Polley; 3, E. J. McKenna.
Brood mare, any age, 1, Dodd Dwyer.

ROADSTER HORSES.

Brood mare with foal, 1, M. E. Armstrong, Bridgetown; 2, F. E. Hilton, Kingston; 3, G. L. Sellars.
Fillly or gelding, 3 years old, 1, C. A. Sellars, Westerly; 2, John F. Cropy, Kensington, P. E. I; 3, A. B. Stronach, Melvern Square, N. S.
Filly or gelding, 2 years, 1, F. E. Hillton; 2, Robert Settle, Jr., Dartmouth; 3, F. W. Foster, Kingston.
Filly or gelding, 1 year old, 1, E. J. McKenna; 2, Robert Settle, Jr.
Foal of 1911. 1, R. A. Backman, Lunenburg; 2, M. E. Armstrong; 3, F. E. Hillton.
Pair matched roadsters, 1, W. W. Black.
Single horse in harness, 15 hands and over, 1, E. J. McKenna; 2, Norman Marshall, Kingston Station; 3, Thos. Munro.

CARRIAGE HORSES.

Brood mare with foal, 1, C. A. Sellars.
Filly or gelding, 3 years old, 1, A.C. Theakson, Lady Hammond Road.
Filly or gelding, 2 years old, 1, B. Keddy, Dartmouth.
Foal of 1911, 1, C. A. Sellars.
Single horse in harness, 15½ hands and over, 1, M. A. B. Smith, Dartmouth; 2, Robertson Bros., Halifax.

PONIES.

Stallion, over 12 hands, 1, Walter Doyle, Halifax.
Mare or gelding, over 13 hands, 1, Wm. Robertson; 2, Geo. A. Thompson, Halifax.
Mare or gelding, over 12 hands, 1, Frank Kehoe, Hammond Plains.
Shetland mare or gelding, 10½ hands or under, 1, F. B. McCurdy, Halifax; 2, Walter Doyle.

GENERAL PURPOSE HORSES.

Mare or gelding, 4 years and upwards, 1, Geo B. O'Brien, Windsor Forks; 2, Robertson Bros, Halifax.
Mare or gelding, 3 years old, 1, Geo. B. O'Brien; 2, Thos. Rose, Urbania.
Filly or gelding, 2 years old, 1, Michael Dwyer, Halifax; 2, John McDonald & Son; 3, A. J. Keddy. Dartmouth.
Filly or gelding, 1 year old, 1, John McDonald & Son; 2, Thos. Rose; 3, A. J. Keddy.
Brood mare with foal by her side, 1, Thos. Aylward, Falmouth; 2, O. O. Ettinger, Shubenacadie; 3, J. M. Daws, Halifax.
Foal of 1911, 1, Thos. Aylward; 2, J. M. Dawes; 3, O. O. Ettinger.
Matched team, 1, Harry J. McKenzie, Shubenacadie.

HEAVY DRAUGHT HORSES.

Mare or gelding, 4 years old, 1, Sharpe & McNeil, Windsor, N. S.; 2, Geo. B. O'Brien, Windsor Forks; 3, H. A. Stewart, Shubenacadie.
Mare or gelding, 3 years old, 1, Sharpe & McNeil; 2, Geo. B. O'Brien.
Filly or gelding, 2 years old, 1 and 2, Sharpe & McNeil; 3, H. A. Stewart.
Brood mare with foal, 1, Sharpe & McNeil; 2, Jas. M. Dawes.
Foal of 1911, 1, Sharpe & McNeil; 2, H. A. Stewart; 3, Jas. M. Dawes.
Matched team, 1, Geo. B. O'Brien; 2, W. W. Black.
Mare and 3 of her progeny, 1, Sharpe & McNeil.

CLYDESDALES.

Stallion, 4 years old, 1, R. S. Starr, Port Williams; 2, Sharpe & McNeil; 3, G. B. O'Brien
Stallion, 3 years old, 1, H. Purdy & Sons, Wentworth Station; 2, Fred S. Black,
Stallion, 2 years old, 1, R. S. Starr; 2, Howard W. Corning; 3, Lee & Clark.
Brood mare with foal, 1, W. W. Black.
Filly, 4 years old, 1, W. W. Black.
Filly, 3 years old, 1, R. S. Starr; 2, Geo. B. O'Brien; 3, W. W. Black.
Filly, 2 years old, 1, R. S. Starr; 2, W. W. Black; 3, Stewart Etter, Shubenacadie.
Filly, 1 year old, 1, Stewart Etter.
Foal of 1911, 1, W. W. Black.
Stallion, any age, 1, R. S. Starr.
Mare, any age, 1, R. S. Starr.
Stallion and 3 of his get, 1, R. S. Starr.
Silver cup, offered by the Dominion Clydesdale Association for best stallion, any age, R. S. Starr.

PERCHERONS.

Stallion, 4 years old.—1, Wm. A. McManus Up. Stewiacke.
Stallion, 3 years old. 1, Samuel Dickie and Son.
Stallion, 2 year old, 1, Chas. Symes,
Foal of 1911, Chas Symes,
Stallion, any age. Samuel Dickie and Son.
Mare, any age, Chas. Symes.

SPECIAL PRIZE.

Queen Hotel cup offered by J. P. Fairbanks, Prop, for the best 5 horses any breed.
R. S. Starr, Silver medal donatedby Hackney Horse Society for best Hackney mare, any age. W. W. Black.

BEEF CATTLE.

SHORTHORNS.

Every prize in this class went to C. A. Archibald, Truro, N. S., without competition.

HEREFORDS.

Bull, 3 yrs. old and upwards—1, W. W. Black, Amherst, N. S.
Bull, 2 yrs. old.—1, Geo. B. O'Brien, Windsor Forks. N. S.
Bull, 12 mos. and under 18 mos.—1, W. W. Black.
Bull, 6 mos. and under 11 mos.—1, W. W. Black.
Bull, under 6 mos.—1, W. W. Black.
Cow, 4 yrs. old and upwards—1 and 3, W. W. Black; 2, Wm. Robertson, Amherst, N. S.
Cow, 3 yrs. old—1, W. W. Black.
Heifer, 2 yrs. old.—1, W. W. Black.
Heifer, 18 mos. and under 2 yrs.—1, W. W. Black.
Heifer, 1 yr. old and under 18 mos.—1, W. W. Black.
Heifer, 6 mos. and under 1 yr.—1, W. W. Black.
Heifer, under 6 mos.—1, W. W. Black.
Champion Bull—Diploma, W. W. Black.
Champion Female—Diploma, W. W. Black.
Bull, and 3 of his get—1, W. W. Black.
Female and 2 of her offspring—1, W. W. Black.
Breeders' Aged Herd—1, W. W. Black.
Breeders' Young Herd—1, W. W. Black.

DEVONS.

Bull, 3 yrs. old and upwards—1 and 3, Chas. G. Pinkey, Melbourne, N. S.; 2, Wm. A. Pinkey, Chebogue, N. S.
Bull, 2 yrs. old—1, Chas. G. Pinkey.
Bull, 18 mos. and under 2 yrs.—1, Chas. G. Pinkey.
Bull, 1 yr. and under 18 mos.—1, Wm. A. Pinkey.
Bull, 6 mos. and under 1 yr.—1, Wm. A. Pinkey; 2, Chas. G. Pinkey.
Bull, under 6 mos.—1, Wm. A. Pinkey; 2, Chas. G. Pinkey.
Cow, 4 yrs. old and upwards, in milk—1 and 2, Wm. A. Pinkey; 3, Chas. G. Pinkey.
Cow, 3 yrs. old, in milk—1 and 2, Wm. A. Pinkey; 3, Chas. G. Pinkey.
Heifer, 2 yrs. old—1, Wm. A. Pinkey; 2 and 3, Chas. G. Pinkey.
Heifer, 18 mos. and under 2 yrs.—1, Wm. A. Pinkey.
Heifer, 1 yr. and under 18 mos.—1, Chas A. Pinkey; 2, Wm. A. Pinkey.
Heifer, 6 mos. and under 1 yr.—1, Wm. A. Pinkey; 2 and 3, Chas. G. Pinkey.
Heifer, under 6 mos.—1 and 2, Wm. A. Pinkey.
Champion Bull—Diploma, Chas. G. Pinkey.
Champion Female—Diploma, Chas. G. Pinkey.
Bull, and 3 of his get,—1, Chas. G. Pinkey; 2, Wm. A. Pinkey.
Female and 2 of her offspring—1, Chas. G. Pinkey.
Breeders' Aged Herd—1, Chas. G. Pinkey; 2, Wm. A. Pinkey.
Breeders' Young Herd—1, Chas. G. Pinkey; 2, Wm. A. Pinkey.

GRADE BEEF CATTLE.

Cow, 4 yrs. old and upwards in milk—1 and 2, W. W. Black; 3, Wm. Robertson; 4, Geo. B. O'Brien; 5, Victor W. Aylward, Falmouth, N. S.
Cow, 3, yrs. old, in milk—1, W. W. Black.
Heifer, 2 yrs. old—1, W. W. Black; 2 Geo. B. O'Brien.
Heifer, 1 yr. old—1, W. W. Black; 2, Wm. Robertson; 3, Geo B. O'Brien; 4, Victor W. Aylward.
Heifer, under 1 yr—1, W. W. Black.
Steer, 3 yrs. old—1, W. W. Black; 2, E. S. Congdon, Berwick, N. S.
Steer, 2 yrs. old—1, W. W. Black; 2, Geo. B. O'Brien; 3, V. W. Aylward.
Steer, 1 yr. old—1, E. S. Congdon; 2, W. W. Black; 3. Geo. B. O'Brien.
Steer, under 1 yr.—1, W. W. Black; 2, Geo. B. O'Brien.
Herd of 4 Animals—1, W. W. Black; 2, E. S. Congdon; 3, Geo. B. O'Brien.
Cow and 3 of her progeny—1, W. W. Black.

FAT CATTLE.

Ox or Steer, 3 yrs. old and upwards—1, W. W. Black; 2, E. S. Congdon.
Steer, 2 yrs. old—1, W. W. Black; 2, E. S. Congdon.
Steer, 1 yr. old—1, W. W. Black.
Steer, under 1 yr—1, W. W. Black.
Cow or Heifer, 3 yrs. old and upwards—1 and 2, W. W. Black; 3, C. A. Archibald.
Heifer, 2 yrs. old—1 and 4, C. A. Archibald; 2, W. W. Black; 3, Wm. Robertson.
Heifer, 1 yr old—1, W. W. Black; 2, C. A. Archibald.
Heifer, under 1 yr—1, W. W. Black.
Pair Fat Oxen or Steers over 3 yrs.—1, E. S. Congdon.
Pair Fat Oxen or Steers, under 3 yrs—1, W. W. Black; 2, Geo. B. O'Brien; 3, E. S. Congdon.

WORKING OXEN AND STEERS.

Pair, 4 yrs. old—1, Chas. A. Tupper, Tupperville; 2, E. S. Congdon; 3, Geo. B. O'Brien.
Pair, 3 yrs. old—1, Geo. B. O'Brien; 2, E. S. Congdon.
Pair, 2 yrs. old—1, E. S. Congdon; 2, Geo. B. O'Brien.

DAIRY CATTLE.

AYRSHIRES.

Bull, 3 years old and upwards, 1, Prescott Blanchard, Truro, N. S.; 2, McIntyre Bros., Sussex, N. B; 3, Retson Bros., Truro, N. S.
Bull, 2 years old, 1, M. H. Parlee, Lower Millstream, N. B; 2, McIntyre Bros.; 3, John McDonald & Son, Shubenacadie, N. S.
Bull, junior yearling, 1, McIntyre Bros.; 2, Prescott Blanchard; 3, John McDonald & Son.
Bull, senior calf, 1, McIntyre Bros.; 2, M. H. Parlee; 3, Retson Bros.
Bull, junior calf, 1, McIntyre Bros.; 2, Retson Bros.; 3, C. A. Archibald.
Cow, 4 years old, 1 and 2, McIntyre Bros.; 2, M. H. Parlee.
Cow, 3 years old, 1 and 3, Retson Bros.; 2, McIntyre Bros.
Heifer, 2 years old, 1, McIntyre Bros.; 3, Prescott Blanchard; 3, Retson Bros.
Heifer, senior yearling, 1, Retson Bros.; 2, M. H. Parlee; 3, McIntyre Bros
Heifer, junior yearling, 1 and 3, McIntyre Bros; 2, Prescott Blanchard.
Heifer, senior calf, 1, McIntyre Bros.; 2, M. H. Parlee; 3, Retson Bros.
Heifer, junior calf, 1, Prescott Blanchard; 2, McIntyre Bros.; 3, J. McDonald & Son.
Champion bull, diploma, Prescott Blanchard.
Champion female, diploma, McIntyre Bros.
Bull and 3 of his get, diploma, McIntyre Bros.
Female and 2 of her offspring, diploma, McIntyre Bros.
Breeders' aged herd, 1, McIntyre Bros.; 2, Retson Bros.; 3, Prescott Blanchard.
Breeders' young herd, 1, McIntyre Bros; 2, M. H. Parlee; 3, C. A. Archibald.

HOLSTEINS.

Bull, 3 years old, 1, Logan Bros.; 2, S. Dickie & Son; 3, Harding Bros.; 4, J. D. Irving.
Bull, 2 years old, 1, Harding Bros.; 2, J. D. Irving; 3, Lee & Clark.
Bull, senior yearling, 1, J. D. Irving; 2, Lee & Clark.
Bull, senior calf, 1, Harding Bros.; 2 and 3, Logan Bros.
Bull, junior calf, 1 and 2, Logan Bros.; 3, Lee & Clark.
Cow, 4 years old, 1, Harding Bros.; 2 and 4, Lee & Clark; 3, Logan Bros.
Cow, 3 years old, 1, Lee & Clark; 2, Harding Bros.; 3 and 4, Logan Bros.
Heifer, 2 years old, 1, Logan Bros.; 2 and 4, J. D. Irving; 3, Harding Bros.
Heifer, senior yearling, 1, Harding Bros.; 2 and 3, Logan Bros; 4, Lee & Clark.
Heifer, junior yearling, 1, Harding Bros.; 2, Logan Bros.; 3, Lee & Clark; 4, J. D. Irving.
Heifer, senior calf, 1 and 2, Logan Bros.; 3, Lee & Clark; 4, Harding Bros.
Heifer, junior calf, 1 and 4, Logan Bros.; 2, Lee & Clark; 3, Harding Bros.
Champion bull, diploma, Logan Bros.
Champion female, diploma, Harding Bros.
Bull and 3 of his get, 1, Lee & Clark; 2, Harding Bros.; 3 J. D. Irving.
Female and 2 of her offspring, 1, Lee & Clark; 2, Harding Bros.; 3, J. D. Irving.
Breeders' aged herd, 1, Logan Bros.; 2, Harding Bros.; 3, Lee & Clark; 4, J. D. Irving.
Breeders' young herd, 1 and 4, Logan Bros.; 2, Harding Bros.; 3, Lee & Clark.

GUERNSEYS.

Bull, 3 years old. 1. Roper Bros.
Bull 2 years old. 1, H. W. Corning, 2, Roper Bros., 3, Jas. McKenzie-

Department of Railways and Canals.

Intercolonial Railway.

Spur Line—Hampton Station to Hampton Village, N. B.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the undersigned and endorsed "Tender for Hampton Spur Line", will be received at this office untill 16 o'clock on Wednesday the 20th day of September, 1911,

Plans, profiles, specifications and form of contract to be entered into can be seen on and after the 31st of August at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa: at the office of the chief Engineer of the Intercolonial Railway, Moncton; and at the office of the Intercolonial Terminal Agent, St. John N. B.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labour, which schedule will form part of the contrac,

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $5000.00, made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part of security, for the due fulfilment of the contract to be entered into,

The lowest or any tender not necessarily accepted.

By order.
L. K. JONES,
Secretary.

Department of Railways and Canals,
Ottawa, 30th August, 1911.

Newspapers inserting this advertisement without authority from the Department will not be paid for it.

Department of Railways and Canals.

Prince Edward Island Railway

Branch Line O'Leary to West Point.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Branch Line, O'Leary to West Point," will be received at this office until sixteen o'clock on Wednesday, September 20th, 1911,

Plans, profiles, specification and form of contract to be entered into can be seen on and after the 4th of September at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa; at the office of the Chief Engineer of the Intercolonial Railway, Moncton, and at the office of the Station Master, O'Leary, P. E. I., at which places forms of tender may be obtained.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labour, which schedule will form part af the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

All accepted bank cheque for the sum of $20,000.00 made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted,

The cheque of the successful tender will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted,

By order,
L. K. JONES,
Secretary.

Department of Railways and Canals,
Ottawa, August 31st, 1911,

Newspapers inserting this advertisement without authority from the Department will not be paid for it.

Chick Feeding Notes.

From a series of experiments on chick feeding conducted at the New York state agricultural college in Ithaca and reported in a recent bulletin, Prof. J. E. Rice drew the following conclusions at the end of the first six weeks:

Wet mash rations were better relished than dry mash or cracked grain. A fine dry mash was difficult to eat in sufficient quantity. Chicks seem to require both cracked and ground food, and to need a variety of food. Chicks reared on wet mash were largest and plumpest; those on the variety ration were most active. The variety ration flock had no mortality to six weeks of age. Wet mash flocks had less mortality than any other flock except that having the variety ration.

Chicks reared on variety ration made slowest growth the first two weeks; those on skimmed milk mash most rapid growth for the first three weeks; those on powdered milk mash made greatest growth in six weeks. Chicks having the variety ration made during the fifth week the greatest weekly gain of the experiment. Chicks having the wet mash and the variety rations made better growth than those having the dry mash or the cracked grain.

Chicks having cracked grain made slightly better average gain than those having cracked grain with dry ground food. Chicks having dry mash made least gain in weight per chick at greatest cost per pound. The wet mash and the variety ration flocks ate less per pound weight and at less cost per pound weight than the flocks having the dry grain rations. The flock having skimmed milk mash cost less per pound weight and per pound gain than those having the powdered milk mash for the first three weeks.

The flock having powdered milk mash ate least per pound weight and at least cost per pound for six weeks. The variety ration cost more for labor per 100 chicks for the first three weeks, but cost less than the wet mash for six weeks. Dry feeding cost less for labor per 100 chicks than the wet mash. Thorough disinfection of surroundings and utensils before using is necessary. The culling out of sickly chicks, together with thorough disinfection, aids in preventing the spread of disease.

Considering the number of chicks reared, the vigor of the chick, and the continued palatability of the ration, the variety ration gave the best results for the first six weeks. In total weight of flock, average weight of chicks, rapid growth and development, cost per pound gain and per pound weight, the wet mash powdered milk ration gave best results. In feeding the wet mash rations and the variety ration, great care must be taken that the chicks are not overfed, and that they do not get spoiled or moldy food. After the first three weeks there is less danger of overfeeding on the variety ration.

Ventilating Stock Barns.

The call for purer air in the housing of human beings as well as of the lower animals has been growing stronger and more insistent for a number of years. Housing to many is coming to be regarded more and more as a necessary evil. Continuous outdoor life would prevent many maladies.

Health is no longer pursued in the main through the agency of the bottle and the pharmacy, which is most usually a negative sort of treatment, but rather of the more sane method of prevention through maintaining a tish vigorous condition of body.

A better understanding of the relationship between germs or microbes and health and illness has led to a higher appreciation of the value of fresh air and sunlight. Many intelligent mothers directed by conscientious physicians allow their babies to sleep during a portion of each day, at least, in the open air at all seasons of the year. By this practice many a frail bit of humanity has been carried over the critical period of its life and started well on towards robust childhood. The most enthusiastic advocates of the "verandah" sleeping room for infants are the mothers who have given it a thorough trial.

THE VALUE OF FRESH AIR.

There is but one explanation of the great value of outdoor sleeping. The sleeper breathes only pure air which thoroughly oxidizes the blood and in this way drives out of the system impurities that would otherwise provide a foothold for disease. What is true in the human family in this regard is equally true amongst the lower animals. Had this fact been understood half a century ago as it is today, it is doubtful if there would have been a need for a Tuberculosis Commission to seek out and suggest ways and means of combating tuberculosis amongst cattle.

For too long, stock owners considered warmth the great desideratum. Not only the men on the land but even college instructors contended that cold or even coolness caused an unnecessary expenditure of energy which had to be met by extra food. Many an ambitious farmer has overcapitalized his plant by putting up expensive buildings—expensive not because of costly fittings but because of good materials and workmanship with a view to keeping out the cold. Owing to the fact that only the owners of highclass herds put up expensive, costly barns, it became the general opinion that good animals and warm stabling go together. No doubt, many persons having inferior stock firmly believe that if landed into fine barns, their herd would quickly improve. Who can estimate, within hundreds of thousands of dollars, extent of the toll tuberculosis has exacted as a result of this fallacy? What highly fed herd has not had its "piners" and how many other wise good cows have gone out "fat" because they had a suspicious cough? Unfortunately, comparatively few stock men have been ready to turn on the light of the official test because they have feared that their business would be likely to receive a "black eye."

TUBERCULOSIS AND BAD AIR.

Tuberculosis amongst cattle reached an alarming extent in many stock growing countries, more particularly where dairying and feeding has been carried on under high pressure and where the climate has seemed to indicate the necessity for well built stabling. It is the ravages that the disease has made that has awakened public opinion and to-day we find the warm stable giving way to the more open structure or at least to one to which the fresh air is admitted as a factor necessary to the health of the stock.

The question is receiving attention not alone on this continent, but also in Europe. The Highland and Agricultural Society of Scotland has carried out a series of experiments to ascertain how far the milk production and general health of cows are influenced by warmth produced through close stabling and whether better results would not be obtained by the free admission of fresh air. The result of these investigations would appear to show that the Scottish cattleman has attached too much importance to warmth and too little to fresh air. It was shown that benefits that might have been derived from the hogher air temperature were nullified by the contaminated condition of the atmosphere, while the greater consumption of food which was expected as the result of the lower temperature has not always been experienced, owing to the healthier condition and better digestion of the animals enjoying the fresh air, which enabled them to make better use of their food.

PLAN OF VENTILATION EXPERIMENT.

The plan followed in these experiments was to erect a complete temporary division across the cow house, dividing it into two parts, one of which was freely ventilated while in the other the ventilation was arranged so that except in frosty weather the temperature remained steady between 60 deg. and 63 deg. F., and did not exceed 65 deg. In the winter of 1909-10 the experiment was conducted in five stables in Scotland, all being in fairly open situations. The air space per cow in the stables varied considerably. Among the freely ventilated stables the least space was 525 cubic feet per cow; the less freely ventilated stables varied in the same way from 480 to 1,432 cubic feet per cow. Taking all the stables, the average space was 843 cubic feet per cow with free ventilation and 839 with restricted ventilation, so that the conditions may be regarded as equal in this respect.

The degree of purity of the air was tested by the proportion of carbon dioxide in samples taken periodically. In this way the air of the stables where the ordinary system of restricted ventilation was in force was found to be much more impure than that of the ventilated stables. In the former, with an average temperature of 57 deg. F., varying from 41 deg. to 69 deg. the average proportion of carbon dioxide in the air was thirty parts in 10,000, while in the latter, with an average temperature of 49 deg. F., varying from 32 deg. to 65 deg., the proportion was fifteen parts. It may be added that the difference in the degree of ventilation was very noticeable in practice; and the sensations of an ordinary observer would have led him to expect a more considerable contrast than is shown by these figures. Yet in spite these stables would have seemed cooler and better ventilated than a large number in use throughout the country.

The influences of temperature on milk yield was not specially considered. The point investigated was whether in practice it would not be better to ventilate cow-houses freely in winter and ignore the necessarily lower temperature produced, and the result is definitely in favor of ventilation. A comparison of the quantity of milk produced under the two systems showed that the production of milk can be carried on at least as profitably in stables ventilated down to 50 deg, as in those in which the temperature is kept ten degrees higher by bad ventilation.

POINTS BROUGHT OUT IN EXPERIMENTS.

Incidentally it has be brought out:

(1). Than any restriction of ventilation sufficient to bring tge temperature of a stable up to 60 deg. F., ends to a degree of atmospheric impurity inconsistent with conditions of perfect health.

(2). That in stables in which the temperatures have been kept down by thorough ventilation in autumn, cows do not suffer either in health or milk yield even from very low temperatures in winter.

(3) That whatever waste of food may be entailed in the maintenance of the body heat of cows in colder stables is more than counteracted by the influence of fresher air; while it is evident that the health of the animals is much more likely to be prompted by active digestion than by the mere prevention of loss of body heat. It should also be observed that the colder temperature in autumn causes the cows to grow and retain thick coats of winter hair; so that it is not even certain that the body heat is better conserved in the less ventilated stables than in those which permit the animals to retain their natural coverings.

PRACTICAL DEDUCIONS.

The practical rules that may be held are valuable to know. A gate may as well possess beauty as not. In fact, the gates that have the best qualities are usually well finished, for good warkmanship is never satisfied without having added to it an attractive finish. An attractive gate will add distinctiveness and value to your property.—J. B. Spencer.

Plowing.

Plowing is the most common work on the farm, and it is also the most important. If the plowing is not done right, no amount of work with any other tool can make it right.

WHAT IT DOES.

Plowing loosens up the soil and turns new portions of it up to be acted on by the elements, so that the plant food that it contains can be made available. In loosening up the soil, the water can get into it more easily, and more of it will get in in a given time. In case of a heavy rain, for instance, much more of it will soak into a deep plowed soil than into a shallow plowed one. The other day the writer was in a part of the country where the crops were suffering for lack of moisture, yet a few days before a heavy rain had fallen. The plowing being shallow the rain could not soak in quick enough so most of it flowed off from the land and into the gullies.

WHEN TO PLOW.

The land should be plowed when the soil is moist. If it is dry, the pulverizing action of the plow is largely lost. When the good housewife makes bread, she does not work the flour, but works it after she has added the water and yeast; she kneads the dough. Plowing the soil when dry would be a great deal like kneading the flour instead of the dough. The best time to plow is in the fall and early at that, as this will give some of the effects of summer fallow. In case the soil is dry in the fall and moist in the spring, better result may come from the spring plowing.—By W. C. Palmer, North Dakota Agricultural College.

Get Rid of Old Hens.

All experiments conducted in egg production indicate that the heaviest laying recotds are made during the first year of production, but that the best eggs for hatching are produced by two-year-olds. In very few cases will three-year-old hens produce enough eggs, on a commercial basis, to pay for their keep. Save, therefore, where a valuable strain is kept for breeding no hen should be permitted to go beyond the second year. Most of the two-year-olds are now pretty well through with their laying for the season. They will bring fairly good prices at the present time and should be marketed at once.

THE MARITIME FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

UOR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—**"I saw" your adv. in the MARITIME FARMER.**

Photographs of farm life, when accepted, will be paid for at the rate of 50 cents each, Communications on all subjects connected with farming and stock-breeding are invited. The publishers will pay a reasonable rate for matter of practical value and for agricultural news. Photos and matter not accepted will be returned on receipt of postage.

RATES FOR CASUAL ADVERTISEMENTS.

2 inch—First insertion 75 cents; 2 inches—First insertion $1.50
3 inches—First insertion $2.25.

PLOWING MATCHES AS COMMUNITY EDUCATORS.

The following article on the benefits of plowing matches appeared in a recent issue of the Nor' West Farmer :—

Why are not more plowing matches being held in the Maritime Provinces ?

"The season of plowing matches is withius. It is a good thing that is recurs every year, for there few events on the calendar of the agricultur al society that are of more importance, perhaps there are no others. As a community educational side of farm life in a way not actually , does lead, agriculturally speaking. It combines the social and educational side of farm life in a way that makes it each year a more popular event. When people from a district twenty-five or thirty miles in extent drive in to a central point to attend the annual plowing match of the agricultural society there must be an inducement to bring them out. That is what is being done in many districts all over the prairies. We attended a match a few days ago and talked with men who had driven in twenty miles.

Someone suggested that plowing matches were becoming less popular in Ontario than they used to be. That can't be true out here. Ontario is getting to be a less popular place in which to live, apparently, than it used to be too. Maybe that is the reason there are not as many plowing match as in former days.

We recently asked a farmer if he thought the plowing match did any real good in his district They held the eleventh annual match there this year. "Well, there can't be any doubt whether or not it does good," said the man. The same question was put to another man at a match last week. "Come over here and have a look at this plowing," he said. "Now that is just about the best plowman in this neighbourhood. He not only plows that way at plowing matches, but that's the way he plows at home, too. Why, come over here. These boys are going to push the men for first place. I've been in this district a good while, and I believe that the boys are doing better work than the best men did when I first come here. What makes the difference ? The plowing match, I say." We walked up and down the field and watched the men and boys at their work. Every furrow ran straight and it was falling over on its fellow in exactly the right way. The field was green with weed growth at the beginning of the contest, but at its conclusion everything was black.

At the plowing match is rivalry. A good eye, a good hand, a good team and a good plow are the essential equipments for a good plowman. What makes the plowing match such a factor for a good community is that it is both social and educational. What young man is not going to plow his best if his best girl is in the crowd watching him ? What young man in the classs for "boys 16 years and under 21" will let a boy in the class for "boys under 16" beat him if he can help it ? And then what man is there there that wants to come out to a plowing match and be beaten by a boy ? Last year's champion is going to do his best to "put it over" the rest of them again this year. The "rest of them" are going to beat last year's champion if it can be done. And there it is—the whole district is going to beat the other fellow in the plowing match. That can't be done on the day of the match. A fellow has to do his best plowing all season. He has to have practice ; so does the team. Everybody gets to thinking about "next year's" plowing match," and are not going to be beaten again by Jack Stewart, Harry Smith or anyone else. Everybody gets to plowing just a little better. Doesn't that help the community ? Ask yourself.

We'll venture the assertion that few boy's ever learned as much about adjusting a plow on the farm at home in one season as they would learn at a plowing match in one afternoon, maybe they would not learn as much in all their lives. If a plow isn't set right it will not work right, that's all. A contestant at a plowing match has his horses hitched right, the clevis pin is in the right hole, the coulter is following in the right line, the skimmer throws the short weeds into the furrow, and the weed chain drags all the larger ones under. And the plow scours. When things go like this there is the minimum draft. The horses do the maximnm amount of work at a minimum expenditure of energy. Plow, team and man are working at their highest efficiency.

Plowing is the basic farm operation, It is important to have good crops and good animals, but the best of either will be produced at a decided handicap if the fields are not properly plowed. That is the function of the plowing match. It does more, too, than simply improve plowing. It makes for better farming in every way. In a beef steer it most always follows that the animal with width of forehead and shortness of face will be deep of body, short of legs, wide of back and thick of flesh. Where good plowing is the rule it most always follows that the summer fallowing is properly done, the seed put in right, the stock are well kept, the house is a "home" and not a "place to live in," the bank account on the right side of the ledger—in short, the good plowman is the good farmer. The fact that an agricultural society has been holding an annual plowing match for a number of years is conclusive evidence that that district is a community of good farmers.

EDITORIAE NOTES.

Small fields are generally to be discouraged because of the great cost in growing and harvesting crops. Rip out some of the inside fences and plow more extensively this fall than ever you did before. You can also gain time in plowing and cultivating and add to the appearance of your fields if you cart away any obstructions, such as stone piles or stumps before you begin plowing.

* * *

The first step in the revision of type is insufficient feeding.

SYSTEM IN FARMING.

No line of work has been more abused by lack of system than farming. The great fertility of the soil has made large crops possible with a minimum of cultivation. Farmers have in many instances in the past gone to their work with little appreciation of the value that good management would be to them. They have looked upon systematic keeping of accounts and study of their business as something effeminate and not in keeping with the kind of work they do. All these things are changing, however, and the farmers of today are beginning to appreciate the value of system in dairying. Perhaps nothing has done more to stimulate this development than the campaign carried on by dairy papers advocating cow test associations and similar lines of work. As soon as a man begins to apply business methods to one branch of farming he finds how much more valuable the work becomes and he naturally branches out and uses similar methods with all of his work. It is good management and system in farm work that will reclaim the abandoned homesteads of the east ; that will make the unproductive acres of the far west profitable and increase the earning capacity of farm land everywhere. Business farming is the only kind of farming that makes it possible for the farmer to know what each crop is costing him ; to know what each animal in the dairy herd is costing and returning ; to know just what profits he may logically expect from any of the departments of his farm. Greater profit must lie in reduced cost of production rather than in the hope of greater selling prices. The latter will vary from time to time but the safe system of increasing the income is by systematizing the cost of production and studying carefully to see where any item may be reduced without harming the output. System and good management raise the farmer to the plane of the successful business man. System and good management will put better fences on the farm ; better stock in the stables ; better comforts in the home ; better barns and soils upon the farm ; and more money in the farmers bank account. There is no line of work that will yield more readily to the influence of the careful and thoughtful study of better methods and more efficient system.

FARMERS NOT DAIRYMEN.

A. L. Haecker says: "The trouble with the dairy business today, beyond a question of doubt, is that it is being carried on by farmers, not dairymen, men who know little or nothing about the profit or loss of the animals they are keeping. This, coupled with their lack of knowledge in care and feeding of such stock, results in a very poor average earning for the ordinary milk cow. It woul d be better for all concerued if more men made dairying a business. As for the small holder and renter, he certainly cannot afford to keep poor cows for it has been demonstrated most thoroughly that the poor cow actually brings about a loss to her keeper instead of a profit and "a few good cows, if any at all," should be his motto. I believe one of the reasons why so many farmers use inferior sires in their herds is that they are not in the dairy business, but that it is a side issue and, therefore, they feel they cannot afford a better sire. This, we know, is a great mistake and perhaps is the one most harmful to the industry from both a local and national standpoint."

HARROWING VS. PRAYERS FOR RAIN.

"If I were to come onto your farm and set 750 teams to work for a week hauling water onto a quarter section at the rate of four tons a day, I would then only put on as much water as evaporates in a week when there is a good moisture content in the soil." Such is the very striking illustration used by President Worst of the North Dakota agricultural college of the great amount of water lost by evaporation.

A thorough harrowing will stop this evaporation and save the moisture for the crop.

Cattle Sheds,
St. John, N. B.,
Roofed with Neponset
Paroid Roofing.

Why Do You Roof With Shingles?

Isn't it because shingles have made a good roof? And because the abundant lumber of days gone by has created the shingle habit? But this shingle habit is giving way to

NEPONSET Paroid Roofing

The Real Rival of Best Shingles

A. L. BOWEN, user, writes:

"A Barn burned next to me on the 4th. The shingled barn caught a dozen times from sparks but NEPONSET Paroid saved house and storehouse. Sparks won't fire Paroid."

Lasts longer. Costs less to buy and less to lay. Gives actual fire protection. Let us send you actual records of NEPONSET Paroid covering 13 years' hard service on barns, factories, storehouses, railroad and Government buildings, etc.

Other NEPONSET Roofings are—NEPONSET Proslate for houses; NEPONSET Red Rope for temporary buildings.

NEPONSET Roofings are made in Canada.

The leading dealer in every town carries NEPONSET Roofings. If you do not know him, write us. Ask for the NEPONSET Book of Roofing Facts.

HORTICULTURE

Heating Orchards.

Heating orchards to protect buds, flowers and young fruit from late spring frosts has proven to be practicable. There are three ways of generating heat in the orchard— by burning oil, by burning coal and by burning wood or brush. Heat is what is wanted, and not smoke. Smoke will help at times, but cannot often be depended upon, especially in rolling lands. In a deep valley the smudge value of smoke would be the greatest. If smoke can be made to hang over the orchard it serves the purpose of preventing the escape of a great deal of natural heat which radiates from the earth.

In some cases it will rarely be necessary to raise the temperature more than two or three degrees in order to save the crop. Swelling buds, full blown flowers, and even young fruit can stand more cold than is generally supposed. The degree of cold that will be fatal will depend upon the stage of development of bud, flower, or fruit. The danger points for peaches are as follows: Buds appreciably swollen, zero; buds showing pink, 15 above zero; almost open, 25 above zero; flowers newly opened, 26 above zero; petals beginning to fall, 28 above zero; all petals off, 30 above zero; "shucks" (calyx tubes) beginning to shed off, 32 above zero. It should be added that the farther along the young fruit is in its development the less cold it can stand. The most tender stage is not when trees are in full bloom. The danger points for apples would correspond pretty closely to the different stages enumerated for peaches.

The danger points mentioned are conservative, as in each case a little lower temperature would not kill but heaters should be lighted as these lines are approached. This applies to oil burners. When coal is used the heaters will have to be started from thirty to sixty minutes earlier, as they are slower in warming up. The same thing is true of burning wood. When the temperature is falling rapidly, in all cases, heaters should be started decidedly earlier than when it is going down gradually. Complete preparations for the heating should be made well in advance. The heaters may have to be filled an left in the orchard two or three weeks before they are needed. In the meantime they must be carefully covered, as rains may occur and wet coal or water in oil, will cause very inefficient fires.

The number of heaters per acre will vary somewhat, depending upon their size and heat-giving powers. No heater holding less than two gallons of oil should be used, as it is not practicable to refill them during the night if used on a large scale. Coal burners also should be large enough to burn from five to seven hours. Used as a protection against spring frosts it will rarely be necessary to keep the fires going longer than four hours—from two o'clock in the morning until six—but in extreme cases they may have to be started as early as eleven o'clock. Always prepare for the worst. For apple and peach orchards it is not safe to use less than sixty or seventy of the larger types of heayters per acre. For the moderate size of both oil and coal burners eighty to one hundred should insure absolute protection. In open strawberry fields at least 125 heaters per acre should be used to insure safety in time of very low temperature. The same is true of vineyards.

There are fifteen or more kinds of orchard heaters on the market, and prices vary all the way from $20 to $45 per hundred. The average price would be about $30 per hundred, regardless of make, as the larger the heater used the fewer will be required per acre, and vice versa. Of course, these figures are only approximate. Oil in lots of less than a tank car (6,000 to 10,000 gallons) costs about five cents per gallon. In car lots the cost is two and one-half cents per gallon. Use nothing but fuel oil of thirty degrees specific gravity. This can be purchased through oil dealers everywhere. Oil may be stored in galvanized iron tanks or in cemented cisterns, where the walls have been coated over with a layer of asphalt paint to prevent leakage. Tanks holding 1,200 gallons cost about $38 each. Where fuel and other things are purchased in large quantities the cost per acre is relatively less. Small orchardists should combine when purchasing supplies.

The cost of heating a fifteen-acre orchard, or larger, the first year would approximatee $45 to $50 per acre. Less than fifteen acres, where the owner purchased alone, the cost would be about $55 to $60 per acre. These estimates include heaters, fuel storage, tanks and labor. Tank wagons would cost extra. After the first year the cost for heating would not be more than $10 to $20 per acre. These figures refer to oil heaters. We do not have the data for coal burners, but they would be no more, and probably less. Where a large block (10 acres or more) is heated the number of heaters per arre will be reduced, as fewer will be needed in the interior of the orchard.—W. J. Howard, University of Missouri, Columbia, Miss.

Few, if any medicines, have met with the uniform success that has attended the use of Chamberlain's Colic Cholera and Diarrhoea Remedy. The remarkable cures of colic and diarrhoea which it has effected in almost every neighborhood have given it a wide reputation. For sale by all dealers.

DAIRYING.

Influence of Ventilation on Milk Yield

The usual practice in milk production is to keep up the temperature of cow-houses in winter as much as possible. Warmth, however, is only secured by the exclusion of fresh air, the temperature being raised by the heat from the animals' bodies, with the result that the air becomes much polluted. It has been recognized in recent years that this system is likely to be injurious to the health of the animals, and particularly as being conducive to tuberculosis. Numerous experiments have been carried out by the Highland and Agricultural Society of Scotland since 1908 in order to ascertain how far the milk production and the general health of cows are influenced by warmth produced in this way, and whether better results would not be obtained by the free admission of fresh air. The result of these investigations would appear to show that in the temperatures we are accustomed to in Britain too much importance has been attached to heat and too little importance to fresh air. Any benefits which might have been derived from the higher air temperature were nullified by the contaminated condition of the atmosphere, while the greater consumption of food which was expected as the result of the lower temperature has not always been experienced, owing to the healthier condition and better digestion of the animals enjoying the fresh air, which has enabled them to make better use of their food.

The plan followed in these experiments was to erect a complete temporary division across the cow-house dividing it into two parts, one of which was freely ventilated, while in the other the ventilation was arranged so that except in frosty weather the temperature remained steady between 60 degrees and 63 degrees F., and did not exceed 65 degrees. In the winter of 1309-10 the experiment was conduced in fivebyres in Scotland all being in fairly open situations. The air space per cow in the byres varied considerably. In the freely ventilated byres the least space was 525 cubic feet per cow, and the greatest 1,268 cubic feet per cow; the less freely ventilated byres varied in the same way from 480 to 1,432 cubic feet per cow. Taking all the byres, the average space was 843 cubic feet per cow with free ventilation and 839 with restricted ventilation, so that the conditions may be regarded as equal in this respect.

The degree of purity of the air was tested by the proportion of carbon dioxide in samples taken periodically. In this way the air of the byres where the ordinary system of restricted ventilation was in force was found to be much more impure than that of the ventilated byres. In the former, with an average temperature of 57 degrees F., varying from 41 degrees to 69 degrees, the average proportion of carbon dioxide in the air was thirty parts in 10,000, while in the latter, with an average temperature of 49 deg. F., varying from 32 deg. to 65 deg., the proportion was fifteen parts. It may be added that the difference in the degree of ventilation was very noticeable in practice; and the sensations of an ordinary observer would have led him to expect a more considerable contrast than is shown by these figures. Yet in spite of this bad ventilation was by no means exceptional, and it is stated that even the worst ventilated of the byres would have seemed cooler and better ventilated than a large number in use throughout the country.

The influence of temperature on the milk yield was not specially considered, as no attempt was made to combine free ventilation with a good temperature kept up by artificial heat The point investigated was whether in practice it would not be better to ventilate cow-houses freely in winter and ignore the necessarily lower temperature produced, and the result is definitely in favor of ventilation. A comparison of the quantity of milk produced under the two systems showed that the production of milk can be carried on at least as profitably in byres ventilated down to 50 degrees F. as in those in which the temperature is kept ten degrees higher by bad ventilation.

Incidentally it has been brought out—

(1) That any restriction of ventilation sufficient to bring the temperature of a byre up to 60 degrees. F. leads to a degree of atmospheric impurity inconsistent with conditions of perfect health.

(2) That in byres in which the temperatures have been kept down by thorough ventilation in autumn, the cows do not suffer either in health or milk yield even from very low temperatures in winter.

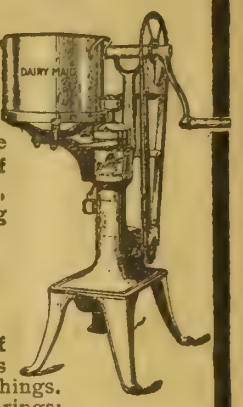
(3) That whatever waste of food may be entailed in the maintenance of the body heat of cows in colder byres is more than counteracted by the influence of fresher air; while it is evident that the health of animals is much more likely to be promoted by active digestion than by the mere prevention of loss of body heat.

How Fat is Lost in Separating.

A great deal of loss in the operation of hand separators might be easily avoided by a little better care of the machine. The great trouble appears to be due to the lack of knowledge that in operating a high-speed machine a small error in care means a big loss in efficiency. This fact becomes more significant when the actual loss of butter fat in the skim milk is determined on a cash basis. With these facts in mind the dairy department of the North Dakota Agricultural College undertook to locate a few of the sources of loss and bring them together in a way to impress them upon the careless or unthinking operator. One of the most common losses in using the separator is due to not flushing the bowl when done separating. The loss is greater with some machines than with others. However, unless a quantity of water or skim milk is run through after the milk is out considerable butter fat will be lost. The object in doing this is to remove the butter fat that may be lodged on the inside of the bowl and the spots. The amount of butter fat so lodging

When The Cow Has Done Her Part

OF COURSE it's important that the cow do her part. But after that, it's up to your cream separator. If it doesn't get highest quality cream—if it doesn't skim to a trace—you are robbing yourself of the profit that your cows have produced.



I H C Cream Harvesters get full value out of the milk, not for a few months only, but through years of constant service. They have proved their durability, close skimming, easy cleaning, and easy running advantages.

I H C Cream Harvesters
Dairymaid and Bluebell

are the only separators with dust-proof and milk-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. These separators have large shafts, bushings, and bearings; the flexible top-bearing is the strongest and most effective found in any separator. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated. I H C Cream Harvesters are made in two styles—Dairymaid, chain drive; and Bluebell, gear drive—each in four sizes.

The I H C local agent will be glad to point out the above features and many others, or, write to nearest branch house for catalogues and other information.

will depend upon the construction of the bowl likewise the temperature of the milk. Often when the milk is below 90 degrees F., or the bowl is somewhat colder than the milk, much cream will adhere to these parts and will be lost unless the bowl is flushed with warm water or skim milk. Often it is a good plan to run a quart of warm water through the machine before starting to separate in order to warm the bowl.
not to use the scalding hot water for this purpose, as it may cause the casein to adhere and clog the machine to the extent of losing considerable butter fat in the skim milk.

Dairy or Milk Houses.

The dairy house, though not a necessity is a great convenience in the dairy farm. It should, if possible, be located near the well so that a tank of cool, running water can be located in it. It should have a solid cement floor. The separator should be located in the milk house instead of placing it in the kitchen on the back porch or in the barn. To keep the milk house clean and sanitary it should be well lighted and ventilated and when possible large windows should be placed on the south side. It is a mistake to use it for anything other than milk. Vegetables, potatoes, wet carpets, have no business in it. They give it a foul and musty odor and always keep it dirty and out of order. A properly constructed, clean and sanitary milk house will add greatly to the production of clean dairy products and prove a great convenience to the dairy farmer. In one milk house which the writer has had the pleasure to visit, was found a small two horse power uprightsteam boiler, a steam power centrifugal separator and a small pump.

Before milking, a small fire was built in the boiler and as soon as it was going well and 5 pounds or more steam was up, the pump was started and enough fuel added to keep up steam until the milking was over. Then the milk is carried to the milk house and the steam turned into the separator. The exhaust steam is connected with a casing around the milk reservoir or supply tank to the separator and the milk is kept at the proper temperature by this. As soon as the separation is up to full speed the milk is turned on and all hands go in for breakfast. The bucket for the cream is set in the water tank and as the cold water is pumped through the tank, the cream is cooled. By the time breakfast is over, the milk is separated. The steam is turned off the separator and into a tank or sink full of water which will be heated and ready to be used in washing the cans, pails and separator after the hogs have been fed. This arrangement works to perfection and illustrates the value of a well equipped milk house.

Dead Line in Dairying.

It is estimated that a cow must produce 4,000 pounds of milk that will produce at least 160 pounds of butter annually before she crosses the dead line between profit and loss i. e., pays for the feed consumed and the labor involved. The manure question is left out, but, if cared for, it will be worth several dollars.

The implicit confidence that many people have in Chamberlain's Calic, Cholera and Diarrhoea Remedy is founded on their experience in the use of that remedy and their knowledge of the many remarkable cures that it has effected. For sale by all of colic, diarrhoea and dysentery dealers.

IHC WAGONS HAVE STOOD THE TEST OF ALL LOADS AND ROADS FOR YEARS

THE real proof of the strength, durabilit , and value of I H C wagons is what they have done and are now doing for thousands of farmers throughout the Dominion. Light loads and heavy loads have been carried by I H C wagons, over good roads and bad roads, for so many years that there is hardly a farmer who is not familiar with the high quality that these names on wagons represent—

Petrolia Chatham

Either of these should be your choice if you want to be sure of lifetime service. The quality in both is the highest possible—the result of years of wagon-building experience, and the use of the best materials, shaped by skilled workmen operating with the finest manufacturing equipment.

Petrolia Wagons are constructed of the finest quality wood stock which is thoroughly seasoned by being air dried. The ironing is of the very best. The inspection of each part is most rigid. Petrolia Wagons must be made so that they will live up to the I H C standard of excellence or they are never sent out of the shops.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Be sure to call on the I H C local agent. Get a pamphlet. Let him show you one of these wagons. If you prefer, write for literature or any other information you want to the International Harvester Company of America at nearest branch house.

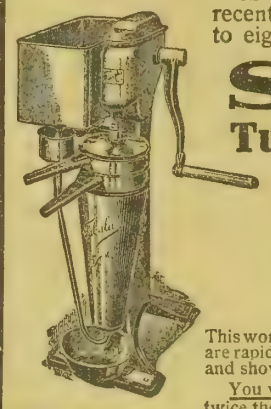
100 YEARS' WORK

And Only One Dollar and Fifteen Cents For Oil and Repairs

A regular Sharples Dairy Tubular Cream Separator recently finished work equal to 100 years' service in a five to eight cow dairy. Here is the record. It proves that

SHARPLES Tubular Cream Separators

are The World's Best.



Size of machine, No. 4 Tubular
Capacity per hour, 500 pounds
Total pounds separated, 2,600,000
Total turns of crank, 14,352,000
Total cost of oil, 75 cents
Total cost of repairs, 40 cents
Time used in oiling, 15 minutes
Time repairing and adjusting, 20 minutes

This wonderful record was made by a regular Tubular—just like Tubulars that are rapidly replacing all others. Write for illustrated account telling all about it and showing how the parts of this Tubular resisted wear

You will finally have a Dairy Tubular because it contains no disks, has twice the skimming force of others, skims faster and twice as clean. Repeatedly pays for itself by saving what others lose. Wears a lifetime. Guaranteed forever by the oldest separator concern on this continent. Our local representative will gladly show you a Tubular. If you do not know him, ask us his name. Write for catalog No. 194.

The Leading Breeds of Sheep.

Their Origin, Development and Characteristics.

THE SHROPSHIRE.

(Continued from last issue.)

The Shropshire as a pure bred is a production of the nineteenth century. It appears to have had a mixed origin, the foundation being a rather diminutive breed, described in 1792 as the Morfe Common sheep, then raised in large numbers in the district of Shropshire, England. These active hardy sheep had at that time black, brown or spotted faces and carried horns. The carcasses of well-fed wethers would weigh from 10 to 14 pounds per quarter, and the fleece about 2½ pounds. This appears to have been the parent form, and the work of improvement commenced in crossing with the Leicester and the Southdown. While these crosses were being introduced and for a number of years afterwards, the stock produced was of somewhat uncertain type, but by the middle of the past century a well fixed and very desirable classs of the Shropshire has been evolved. Soon after that time, through the efforts of their breeders they were recognized as a distinct breed. They were at that time described as being without horns, with faces and legs of grey or spotted color; the neck thick with excellent scrag; the head well-shaped, rather small than large, with ears well set on; breast broad and deep; back straight, with good carcass; hind quarters hardly as wide as the Southdown, and the legs clean with strong bone. They were hardy, thrifty, and matured early, producing from 80 to 100 pounds per carcass and about 7 pounds per fleece.

By careful selection and judicious mating of its own spieces, the Shropshire sheep seems to have been brought to a very high state of perfection. In 1853 they received their first recognition as a pure breed by the Royal Agricultural Society of England. Until about 1870 grey and speckled legs and faces and open fleeces were not uncommon, but these markings and other evidences of mixed breeding gradually disappeared. For the past thirty years the color of the face has been a rich brown, unless covered with wool, as are many of the finest specimens of the breed at the present day, almost to thethe point of the nose. A little grey or 'mealy' color about the muzzle is not considered objectionable.

The Shropshire sheep was given a classification separate from the Southdowns, Hampshires and Oxfords as early as 1859, and soon after that year far surpassed any other breed exhibited in point of numbers. In 1882 the display of Shropshires at the Royal Show, held at Shrewsbury numbered 845 against less than half that number of all other distinct breeds combined. The breed rapidly spread to every part of the United Kingdom and is now to be found in large numbers in all parts of the world where improved sheep are kept.

No single outstanding breeder, like Bakewell, Ellman, or Humphrey, who are credited with bringing out the Leicester, the Southdown and the Hampshire, respectively, actually accomplished the chief improvement of the Shropshire. This was shared by many and progress seems o have been gradual.

Going back to the fifties of the last century, we find the names of prominent breeders as follows: Messrs Henry Smith, of Sutton; Green of Marlow; Hanton, of Shrewsbury; Farmer, of Brignorth; Adney, of Harley, and others whose ewes were at that time sold at auction for prices from $20 to $75 per head. The flocks of these breeders and thers may be looked upon as the foundation of the present breed and their blood flows in the flocks of the present day.

As a combined wool and mutton sheep the Shropshire holds a prominent place. The body, though larger is like that of the Southdown, being low-set, thick and fleshy. It carries a large proportion of lean meat which is held high in favor by the butchers. The fleeces is dense, uniform and approaches that of the Southdown in fineness; ewes shear from 7 to 10 pounds and rams from about 9 to 11 pounds of unwashed wool.

For crossing and grading the Shropshire occupies a wide field. Rams of the breed are very generally used upon common and grade Merino stock in the range districts. Even from quite inferior ewe foundation the offspring from Shropshire males is blocky, thrifty and early maturing, almost invariably showing dark faces and legs. At many of the fat stock shows grades bearing the Shropshire occupies a wide field.

Shropshire Ram.

of the best prizes. The early maturing qualities of the Shropshires are pecuniarly valuable owing to the extent to which they are used in crossing.

Shropshire breed associations are strong both in Great Britain and America and pedigree registration is carefully maintained in both countries. The American Shropshire Registry Association was organized in 1884, and up to the end of 1907 more than 270,000 animals bred chiefly in Canada and the United States, had been registered. A large number of pedigrees have also been registered in the Canadian National Records.

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learned that in the

Frictionless Empire

Empire Line

Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Farmer Agents Wanted in Unrepresented Districts.

Cankers in Pigs.

Canker sore mouth is one of the most destructive pig diseases, generally causing death of the affected animals, unless prompt treatment is given. The cause is probably a fungus. At any rate, it is quite contagious. Ordinary sore mouth, which is so troublesome to suckling pigs, is quite similar to the canker sore mouth, but is caused by bacteria. This simple sore mouth is quite easily cured by the directions given in Wallace's Farmer, according to which the heads of the affected animals are thoroughly disinfected by either a hog dip solution of potassium permanganate dissolved in water at the rate of one ounce to the half gallon. For canker sore mouth, however, these disinfectants are not strong enough.

The first step in treating canker sore mouth is to separate all affected animals from the well ones. As insurance, it is a good policy to treat the well ones which have been exposed to this disease by rubbing on their heads an ointment made by mixing one ounce of carbolic acid in one-half pint of raw linseed oil. Of the sick animals there are generally two sorts—the seriously affected ones on which the sores gre open and the flesh has sloughed away, and those on which the sores have not yet broken out. These latter on which the sores have not yet opened are best treated with an ointment made by mixing one-half ounce of iodine in eight ounces of vaseline. This should be repeated every three days. The first step in treating those animals on which the sores have broken out is to cut out all diseased flesh. This is followed by the use of some strong disinfectant, such as terchloride of antimony, silver nitrate, or copper sulphate. Terchloride of antimony sometimes goes under the name of butyr of antimony, and our correspondent who has been unable to secure it at his drug stores will probably be able to get it under this name. If not, we are quite sure that he can get it at larger drug stores. Both terchloride of antimony and silver nitrate may be applied to the wound by means of a feather. If copper sulphate is used it should be mixed with water at the rate of one ounce of copper sulphate to a pint of water. If, in three days after treating with any of these three substances, the wound appears healthy, it is then a good plan to wash it with a little tobacco concoction and apply some tar to the wound. If this is done thoroughly, the disease should be healed, but if it breaks out again the treatment must be re-

The Wheel That Has Made GOOD!

Reduce Farm Labor 25 to 50 Per Cent.

Put T-K Wide Tire Steel Wheels on your wagons and you can haul 25 to 50 per cent. heavier loads without causing any heavier draft. Our steel wheels make heavy loads light and are so durable that they will stand any strain over the rockiest road. They last a lifetime with practically no attention.

T-K Wide Tire Steel Wheels and Handy Farm Wagons

Our Handy Farm Wagons are acknowledged to be the best all-purpose wagons ever used on a farm. They have a lighter draft and are easier to load and unload than all the others. We guarantee them to be great money-savers and the best trucks on earth for the price.

Write and ask about them.

Agents Wanted!

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Steel Ladder.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co., Sussex, N. B.

It will pay you to start your letter with the words: "I saw your adv. in The Maritime Farmer."

peated. The trouble in a severe form rapidly exhausts the strength of affected animals, and consequently it is following twice daily: A dessert well to give some such tonic as the spoonful of brandy and one egg beaten in milk, and two grains of quinine In order to prevent future outbreak, the pens and yard occupied by the affected animals must be thoroughly disinfected.

Artificial Wallow.

Everybody knows how in hot weather a hog, if it has the opportunity, will hunt a mudhole to wallow in. A hog does this, not because of his natural love of filth, for it is by nature a cleanly animal, but because it serves to cool off his body and to free him from the torments of lice and other insects.

The hog is very poorly equipped to withstand the heat of the sun. Unless his surroundings are kept clean and he is dipped frequently, he will be lousy. The wallow, by disposing of lice and by bringing about a cooling effect, increases the comfort of the hog, and as a consequence increases his growth and thriftiness.

The mudhole is unsightly and very unsanitary. Many practical hog growers are now using artificial wallows, built of either cement or lumber. These may be frequently cleaned out and filled with fresh water. Then by the addition of some of the coal-tar preparations, lice and other insects may be killed and the skin kept clean thus doing away with all dipping.

These vats or wallows may be easily and inexpensively constructed. They should be ten or twelve inches deep and not less than eight feet square, with a rim around the edge to prevent slopping over, and a slope on one side for the pigs to run on.

A one percent solution of a coal-tar preparation will generally be sufficient to kill all lice and keep the skin free from scurfiness. When the vat is placed in the sunlight, the pigs will not lie in it very long, but will run in and out, thus allowing it to be used for a greater number. One eight feet square will do very well for five sows and their litters.—A. E. Chase.

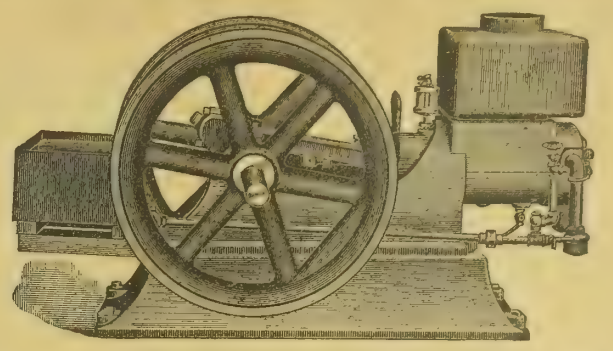
Flushing the Ewes.

Flushing the ewes is a practice followed out by the best English shepherds. This practice is also followed by some Canadian and American farmers. As high a percentage of lambs as possible is desired. Flushing tends to make the ewes more sure as breeders, and also results in more twins. The breeding ewes usually run on pasture after their lambs are weaned, and thus do not maintain a high condition. Two or three weeks before breeding time an extra allowance of feed is given. This feed is such that it will rapidly increase the weight of the ewes. Alfalfa or clover hay, together with corn silage, and some of the concentrates, such as oats, barley, dried brewers' grains and the like, are usually fed. This extra feeding to improve the condition of the ewes just before breeding is known as flushing.

Live Stock Notes.

To attempt to fatten sheep affected with lice and scab is to court loss and possible disaster.

It is estimated that the cost of maintaining 100 breeding ewes in good condition is $1 per day, or one cent per head, when kept on corn fodder, beets and oats.



The Waterloo Boy Gasoline Engine

s like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new postitive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogue is free. Write to-day.

The Waterloo Gasoline Engine Co.

J. D. FRIER, Sussex, N. B., Eastern Representative.

What the "Crown" Gang Plow does

One man instead of two

Three horses instead of four

One "Crown" Gang Plow instead of two single furrow Plows

Make this test: The first day give your hired man a single-furrow plow and two horses. Take another single-furrow plow and two horses yourself. Then, do one day's plowing. Together, you will plow three acres, under favorable conditions.

Next day, use the "Crown" Gang plow and three horses. You'll find that you can still plow three acres.

The second day the same work has been done with one man instead of two, three horses instead of four, one "Crown" Gang instead of two single-furrow plows. What this saving means to you in dollars and cents you can figure out for yourself. But it is enough to pay for the "Crown" Gang in a few weeks.

The "Crown" Gang stays right down to its work. It turns the furrows more evenly than a single-furrow plow. The easy-working levers are conveniently located. The wheels have dust-proof boxes with roller-bearings. You should learn more about the "Crown" Gang right away, and about our special orchard gang plows, too. So write for CATALOGUE B 40

THE HORSE

Expert Counsel about Buying Horses

If you are not conversant with the anatomy of a horse you had better not try to buy a horse on your own judgement unless you are purchasing from a responsible house or a well-known dealer who has a reputation to uphold. But if you are an enthusiastic buyer on your own account, perhaps the writer can give you some hints that will be useful, and it may be, save you loss.

After you select the horse which you think has captured your fancy it might be best to have him brought out for careful examination. Be sure that he is cool and not in a heated condition; remember that horses are subject to every ailment and disease that human flesh is heir to; that he has temperament, disposition, individuality and needs to be very carefully bought.

The first thing you look at is his foot—no foot, no horse; it should be on the concave order, a deep sole and not too narrow; this denotes breeding. Run your hand down his forelegs, examine for splints; if on the bone they will never hurt him, but if on the tendons drop him like a hot potato, no matter how small the splint.

To save the time and trouble have him jogged quietly down on the floor, on stone or cement if possible, and look for lameness, and see if his style of going suits you. Now examine his coronets for sidebones; take a look at his eyes, and that very closely. Stand in front of him to see that he has a full chest; glance between his forelegs at his spavin joints; run your hand over his kidneys and press hard as you do so; pass behind him and see that he stands square; examine for curbs, a curb will never hurt a horse after he is six years old; feel his hocks for incipient spavins or bruises on the cap of his hocks, which require a satisfactory explanation from the owner. Don't forget to look for thoroughpins and bog spavins; look carefully at his hips that they are both alike; personally I would never buy an interfering horse, or a horse that shows symptoms of it.

See that your intending purchase is well ribbed up; long backed, narrow-gutted horses are bad feeders and doers and cannot stand their work. See also that he has plenty of neck, good, high shoulders and sloping back. Then proceeding, ask the holder of the horse to walk quick into his flank both ways, turning him quickly; then back him while you look carefully for symptoms of the springhalt or cramps.

If up to this time the horse has borne inspection favorably put a man on his back and gallop him as fast as he will go to test his wind for a whistling sound. If all right have him put in harness to see if he has any vice. Stable habits, such as weaving, wind sucking, cribbing and halter pulling, must be left to the veracity of the seller's word, as they are only detected when the horse is standing quietly in the stable.

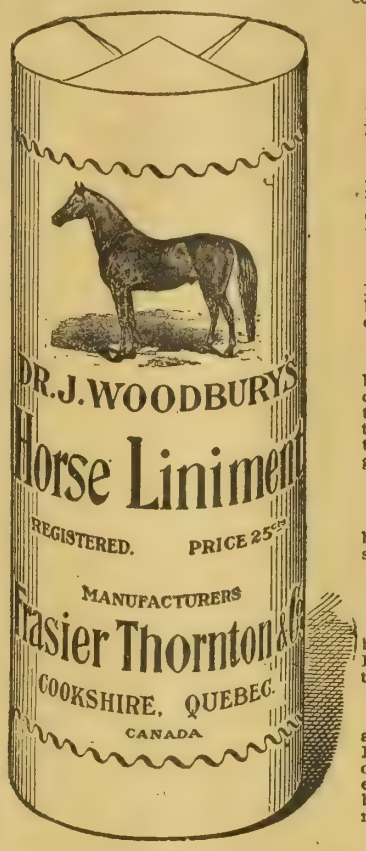
In the matter of age four years old is not preferable. You are taking chances with the young horse. I had rather buy a horse at eight than five, as he is then in his prime, and his habits are all developed; if a horse has arrived at that age and maintained his soundness, you can rely upon him being a good one. If he fills the bill, buy him; good horses are scarce.—"Dick," in Farm and Dairy.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal, Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an applicatiou of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.



Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S,

Dear Sirs :—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs :—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly, C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right," 5817.

Elmsdale, N. S.

Dear Sirs :—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs :—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

Dear Sirs :—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

Colt Management.

Almost as soon as the colt is born it should receive a good feed of colostrum. If the colt does not receive this food intended for it by nature, it will have digestive troubles from the first. The trouble can be avoided, however, by giving the colt a gentle purgative of castor oil. Either too much or too little milk will be detrimental to the best development of the young foal. If the mare is milking too freely, it is well to decrease her quantity of feed, and if necessary draw some of the milk by hand. If on the other hand the colt is not being sufficiently nourished, the mare should be put on good pasture, or if pasture is not available, or it is too early in the season, oats and bran fed as a mash will increase the milk flow.

EXTRA FEED WHILE ON PASTURE.

When we are anxious to see the colts start well when on pasture we build a feeding corner in the field where the colts can go and get additional feed, but into which the mares cannot enter. By feeding the mares a few times in this corner, we will get the colts accustomed to go there. After that the mares can be kept out and the colts can run in and out at will. The mare needs an additional feed as well as the foals. A common mistake made is neglecting to feed the foals while running with their mothers. When weaning time comes, the foals do not know how to eat grain and they get a great set back.

EXERCISE IMPORTANT.

Give the foal lots of exercise when it is weaned. One of the biggest mistakes made in colt management is to shut the young animal up in a box stall. Scotch horses have a reputation for possessing excellent feet and legs. This is because the colts are allowed to run out all the time. The colts should be out every day in the year, three or four hours at the least, if the weather is at all suitable. If the weather is wet and disagreeable, however, they are better kept in. When in fresh air colts grow faster and put on stronger bone and muscle than when pampered.

DON'T KEEP COLTS TOO FAT.

Many colts are ruined by overfeeding. Too many of us want to see them fat when they are one year old. In the Old Country they raise them thin. Show ring judges in this country put a premium on over feeding by giving the ribbons to the fat colts. The standard for judging colts should be the quality of the feet and legs and the indications which they give for making a first class horse. Too many expect the colt to be at maturity when two years old. In Scotland, where they produce some of the finest draught horses in the world, the best of them are not fitted until three years old, are shown in a thin condition, and judged accordingly.

DANGER IN MILK.

I have seen many colt owners feeding milk to shove their animals to maturity. A better way of manufacturing wind suckers I do not know. Other owners are very much afraid of seeing a big belly on the colt. A big belly is not undesirable; in fact, it is to be desired on a young and thrifty animal. There is no danger of it disfiguring the animal later on, as the horse will grow up to its belly.

Perfect cleanliness in all feeding operations should be adhered to. Many feeders never clean out the mangers from one feeding time to another. An hour or two after each feeding we should go round and clean out the mangers, and if any feed is left there, reduce the feed at the next feeding period.—R. Smith in Farm and Dairy.

POULTRY.

International Egg Laying Competition.

Arrangements are now being made to hold an egg laying contest, commencing Nov. 1st, 1911 and continuing for one year.

The contest is being financed by "The North American" of Philadelphia. Steps have been taken to enlist the services of some of the best equipped and most capable men in the whole field of poultry husbandry to serve as an advisory board, and acting in this capacity, formulate the rules and regulations under which the competition is to be conducted and have constant oversight of the details of management. The advisory board consists of nine members, including men who have at heart the best interests of the fancier and the utility poultryman. As now constituted the membership is as follows:—

Prof. J. H. Stoneburn, of Storr's Agricultural College, Storr's, Conn.; Prof. Thomas F. McGraw, International Correspondence Schools, Scranton, Pa.; Prof. Homer Jackson, State College, Pa.; Dr. A. A. Brigham, South Dakota School of Agriculture, Brookings, S. D.; Dr. Prince T. Woods, Managing Editor American Poultry Journal, Chicago, Ill.; Dr. Nathan W. Sanborn, Editor American Poultry Advocate, Syracuse, N. Y.; Prof. F. C. Elford, Macdonald College, Canada; George A. Devitt, The North American, Philadelphia, Pa.; F. V. L. Turner.

It is hoped that many Canadian pens will be entered. There are a goodly number of breeders in Canada who have hens that know how to lay that ought to be represented in this contest. The climate in Connecticut is ideal, the thermometer seldom goes much below zero, little snow and plenty of sunshine, so that a good Canadian layer should do just as well or better in the competition surroundings. The houses are being constructed for the purpose and therefore will be all new. There are to be 50 houses 12x12 feet, 6 foot walls and partially open front with plenty of windows. Each house will be divided into two allowing two pens of five birds each. This will give 14 square feet to a bird. The rations will be whole grain and dry meal.

Liberal cash prizes will be given also cups and trophies of various kinds.

RULES AND REGULATIONS.

Philadelphia North American International Egg Laying Competition.

1. The first egg laying competition held in the United States has been inaugurated and will be conducted under the auspices of the North American, a newspaper published in the city of Philadelphia and shall be known as the Philadelphia North American Egg Laying Competition.

2. This competition is to be held on the grounds of the Storr's Agricultural Experiment Station, Storr's Conn.

3. The time of beginning of the competition shall be November 1, 1911, and extend over a period of one year from that date. Entries will be limited to 100 pens.

4. Each entry to consist of six pure bred females, either hens or pullets; no males to be included. Five layers shall constitute a laying pen, the extra female being held as a substitute in case of death or incurable

5. All fowls must be shipped express prepaid.

6.—Fowls will be received at any time from October 2 to Oct. 25. It is advisable that shipment be made as early as possible after Oct. 1, in order that fowls may become acclimated previous to the date of opening.

7. The right is reserved to return fowls if they are deemed unsuitable for the purpose of competition and every specimen sent must be full sized, healthy, vigorous. The right, of course, is reserved to refuse any and all entries.

8. An entrance fee of $25 is required in each case, $10 to accompy application and balance not later than Oct. 1. In the event of failure of entrants to make second payment the first payment shall be forfeited.

9. All eggs produced will be retained for the purposes of this competition.

10. No appeal from the decision of the committee in any matter pertaining to the competition will be entertained. When the fowls have been received at the Storrs Agricultural Experiment Station and placd in pens, they will be protected with armed gugrds, locks and watchdogs. None of the parties to this competition will in any manner be responsible for losses, nor will they be responsible for death or destruction of any fowls.

11. Should any surplus over and above the economical operation of the competition appear, such surplus will be equally divided between the several owners of the pens.

12. All fowls entered must be of some recognized breed or variety. Mongrel or cross-bred fowls will not be accepted.

13. Any fowl suffering from an infectious or contagious disease of any kind, or which may not meet the requirements, as viewed by the committee, will be rejected and excluded from this competition.

14. The Committee reserves the right to clip or cut the feathers of one wing on any fowl that may be inclined to fly out of the enclosure.

15. The competition to be decided by the total number of eggs laid by each pen.

16. No competitor shall be permitted to withdraw any of the fowls during the period of competition, unless permission is granted by a full vote of the committee.

17. Chickens only will be eligible to this competition, and only such chickens as produce marketable eggs; ornamental chickens including all bantams, are therefore ineligible.

18. Entries will be received from any point in the world.

19. The competition will be governed by the advisory board.

Canadian breeders wishing further information or application blanks please apply to F. C. Elford, Macdonald College, P. Q.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box 309. P, Windsor, Ont.

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

The Banwell Hoxie Wire Fence Co., Ltd.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Love's Barrier

(Continued from last issue.)

CHAPTER VIII—Continued.

"He went to Colchester, dear, to see the lady he is going ta marry."

Audrey gave a little scream.

"The lady he is going to marry! Mr. Secretan! Why, I thought, we all thought, he believed in the celibacy of the clergy."

"He did until he met this lady. Fortunately, I never took him quite seriously. I have been preparing myself for this, and yet—and yet—when he told me to-night I felt bad, and just a little rebellious."

Audrey leaned her elbows on her knees and stared across the intervening space with wide, understanding, sympathetic eyes.

"I know it is hard on sisters. It must be, but still if he is going to be happy, Miss Jane, we must only be glad. He is so good, so splendid in every way, he deserves happiness."

"He does, and I hope he will be happy," said Jane quietly. "It is going to take place very soon, Audrey, in a month's time."

"How frightfully exciting! Do tell me about her. Is she young? Is she pretty? Shall we like her? Is he very fond of her? What a splendid husband he will make, and how proud she will be of him!"

"I haven't seen her, but I think she is beautiful. Claude says so, at least. Her father was in the army, and I think from what Claude says she has not had a very happy life. She is not quite young, nearly thirty I believe."

"How exciting!" repeated Audrey. "And may I tell mamma? It is not a secret, I suppose; at least, it can't be a secret long."

"It is not a secret at all, and you can tell everybody, dear. My brother wishes people to know. It was only settled yestrday. I believe; and they are to be married by special license in London."

"You should have told Lydia Rash, and she would have popped into dear Ann Coyne's, and by morning the whole of Midcar have been by the ears," said Audrey, smiling broadly. Then suddenly she grew sober again, arrested by something hauntingly pathetic in Jane Secretan's face.

"Of course, this will make a great difference to you, Miss Jane, but surely you will not leave the Rectory."

"Yes, I must leave, of course; and at once. It would not be fair, Audrey, to the young wife. Now, here is your carriage. Let me wrap you up and put you in."

Audrey sprang up, and when Jane took her cloak, she suddenly put her slim white hands on the elder woman's shoulders, and looked right into her kind eyes.

"My dear Miss Jane, we haven't any of us, been as kind to you as we ought to have been! But we love you, we all do. You will find it out from Midcar when they hear you are going. If twenty wives came to the Rectory they would never, never fill your particular place."

Jane nodded and dashed away a troublesome tear.

"There, there dear child, I shan't forget your words, and don't go away imagining I am going to be miserable or out in the cold. The Lord will find me something; in fact, I think He has found it already. Thank you so much for coming. If you knew how the girls look forward to it and treasure up everything you do and say, you would not grudge the trouble."

"I don't grudge it in the least. I only wish I could leave them something worth treasuring," replied Audrey; and the next moment Jane was alone.

She closed the door and went back into the small bare cottage room and looked round it with a strange feeling that something had suddenly snapped in her life. This centre for young life and the young interests of the Midcar girlhood belonged to her, she had created it, and what would become of it in a month's time when the new wife should arrive to take over all her duties and responsibilities? Many a homely talk she had had with lonely and troubled girlhood in that very room; many a one she had grasped by the hand just at the moment when temptation yawned in frn front and round about her. She knew that she had saved many a one by her wise sisterly counsel. Who would fill her place? She knelt down suddenly on the bare floor and asked that her way might be opened up. She believed that nothing would be lost, that no effort, however feeble, no groping, however blind, towards the upward way, could come wholly to naught. She felt better after that prayer. The emotional moment provoked by Audrey Hayes' swe?t sympathy passed, and left her calm, strong and unafraid.

She quietly put out the lights, closed the inner dors, and turned the key of the outer one in the lock. Then she stepped out into the night. The rain had ceased, and the sky was breaking overhead. The song of the roysterers was still sounding from the low rafters of the tavern hard by. Jane sighed a little as she turned away from it. It was a bad place. She had done her best to get it closed, but without avail. The lord of the manor of Mardocks, a perpetual absentee, took no interest in the welfare of the village, and appeals to agent or bailiff were in vain. The street was quiet. Most of Midcar folks were early, and village lights would be out by ten o'clock. She turned to climb the steep slope to the Rectory gate, and presently, in the middle of the road, saw a tall figure swinging down. In the grey dark of a cloudy night which hid the moon she did not at first recognize the man, but presently had no doubt but that it was Tom Courtney, of the Court Farm.

She easily surmised his business in Midcar so late; he was making straight as a bee-line for "The Rose and Crown," where he had spent many a night to his own undoing. She felt chilled and disappointed. He had so faithfully promised her to give up his late nights and his dissipated days and to turn over the new leaf, for which poor Emmy had so often and so vainly prayed.

She confronted him and stood still, so that he was obliged to stop.

"Good evening, Mr. Courtney. You are late in Midcar, surely," she said cheerfully.

He mumbled something, taken aback at being caught.

"I've a little business to do at 'The Rose and Crown' Miss Secretan. It won't take me more than ten minutes or so, then I'll get across the fields to the farm."

"No, you don't," she said quite firmly. "There's no business that a man will be the better of doing to night at that place, Mr. Courtney. You come right back with me to the Rectory and have a bit of supper."

"I can't, Miss Jane, really. I've to meet a man there. He's waiting for me now."

"Stuff and nonsense, Tom. If it were daylight you couldn't look me in the face and say that over again. Give me an arm up the hill, and I'll tell you the most astonishing bit of news that has been heard in Midcar for a long time."

Courtney hung back, something in Jane's manner compelling him, yet longing for the company of his kind, and the oblivion of forgetfulness in the brightly lighted tavern below.

"Come, Tom, you've often called yourself a fool, but I wouldn't be a silly one if I were you," said Jane, speaking in a tone which would have surprised any one who knew her only in her gentler moods. "And what did you promise me only yesterday?"

"Well, it's rotten up there, Miss Jane. I see nothing but Emmy's eyes. They're all over the place. You wouldn't be so hard on a chap if you could just step into his place for four-and-twenty hours. I tell you the quiet of the place is going to finish me, and not a soul to speak to from morn till night."

"That's going to be altered," said Jane cheerfully. "Come up the road with me and I'll tell you all about it. I've found you a housekeeper."

Still Courtney hesitated, torn betwixt two. He had a sincere liking for the Rector's sister, who had never feared to speak her mind to him, even in Emmy's lifetime. Poor Emmy, who had been far too sensitive and shrinking for life with such as he! Jane Secretan would have made a better man of Courtney, had he crossed her path earlier in life. But the old craving for the drink was strong upon him; he almost threw off the restraining hand on his arm.

"Come!" said Jane coaxingly. "We've got a nice bit of cold bacon and a rabbit pie for supper, and the Rector will be more than pleased to see you. We only wish the Court Farm was not so far off, so that you could come oftener. Come, Tom!"

"Well, I will, but I don't want to," he said heavily. "I want nothing but a good stiff glass and a shake of the hand from some of my pals down by. They'll be glad to see me there, too. They've missed me. They don't turn there backs on a chap because he's down, and because a lot of lies have been spread about him."

He referred to the rumors that had been circling thick and dark through the parish about his wife's untimely death, which had no doubt been hastened by his hard way of life.

"Much good their friendship will do you Tom! I could prove to you that some of them have lied more than anybody about you. Come, don't, you want to hear about the new housekeeper?"

"Well, I suppose I do. I need somebody badly. You should have seen the supper sent into me tonight. A hog could hardly have got through it."

"Well, I promise you the new housekeeper will be able to set a decent meal in front of you, because I have eaten many a one of her cooking, and the Rector will tell you the same thing."

"Who is she anyway?" asked Courtney as they turned up ehe hill, Jane still keeping fast by his arm.

Yes

ALL teas may look alike to you—but the difference in Red Rose Tea is in the taste and the smell. Another marked difference is the agreeable strength that puts real quality in the cup with less tea in the pot. Will you try it.

99

RED ROSE TEA "is good tea"

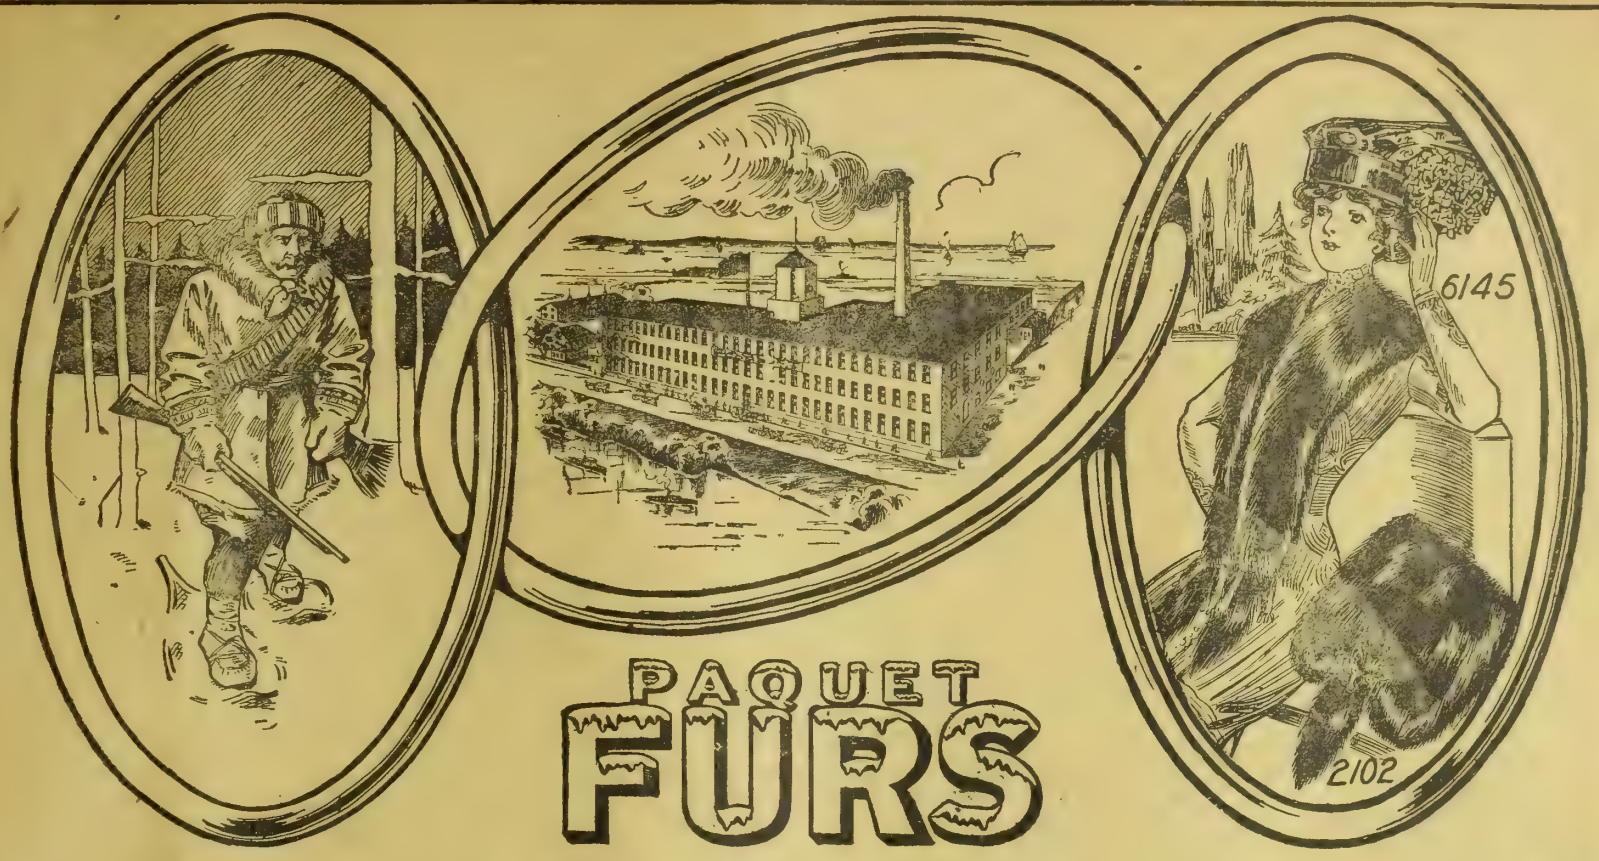
SEVEN YEARS OF MISERY

All Relieved by Lydia E. Pinkham's Vegetable Compound.

Sikeston, Mo. — "For seven years I suffered everything. I was in bed for four or five days at a time every month, and so weak I could hardly walk. I cramped and had backache and headache, and was so nervous and weak that I dreaded to see anyone or have anyone move in the room. The doctors gave me medicine to ease me at those times, and said that I ought to have an operation. I would not listen to that, and when a friend of my husband told him about Lydia E. Pinkham's Vegetable Compound and what it had done for his wife, I was willing to take it. Now I look the picture of health and feel like it, too. I can do my own housework, hoe my garden, and milk a cow. I can entertain company and enjoy them. I can visit when I choose, and walk as far as any ordinary woman, any day in the month. I wish I could talk to every suffering woman and girl." —Mrs. Dema Bethune, Sikeston, Mo.

The most successful remedy in this country for the cure of all forms of female complaints is Lydia E. Pinkham's Vegetable Compound.

It is more widely and successfully used than any other remedy. It has cured thousands of women who have been troubled with displacements, inflammation, ulceration, fibroid tumors, irregularities, periodic pains, backache, that bearing down feeling, indigestion, and nervous prostration, after all other means had failed. Why don't you try it?



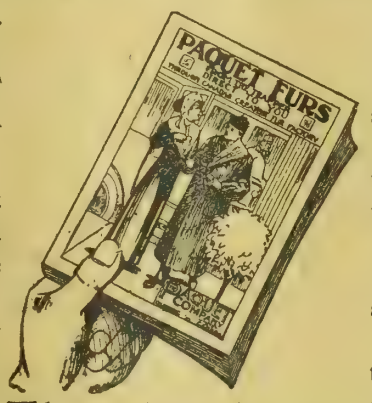
PAQUET FURS

The Connecting Link Between Trapper and YOU

CANADA'S Largest Fur Factory is the connecting link between the Trapper and YOU. Here we manufacture the famous PAQUET FURS, which are recognized as the Standard of Quality from Halifax to Vancouver.

And when we say "manufacture" we mean just that. We do not buy the skins ready dressed and dyed, and make them up at an enormous expense which YOU must help to pay. If we did, we'd have nothing unusual to talk about. We buy the skins in the raw—dress them and dye them ourselves—and then make them up in our own workrooms. This is the ONLY Fur Factory in AMERICA where every process, from dressing of the raw skins to the finishing of the Fur Piece or Garment, is in operation under the one roof.

We employ only the most modern processes of dyeing and finishing. Every member of our vast army of workers is an expert in his line.



This Handsome Fur Catalogue

containing 80 pages of illustrations and prices of PAQUET FURS, will be sent you FREE upon request. This is the most beautiful Fur Catalogue ever published in Canada. Write NOW!

This is because Fur has been to their fathers and grandfathers what it is to them—a life study. It stands to reason that with all our advantages we should turn out the very best Furs on the Canadian market, doesn't it? And that we do is testified to by thousands of Canadians who have spent to date more than EIGHT MILLION DOLLARS for PAQUET FURS. Quite a tidy little sum, isn't it?

And what's more, every one of these purchasers is a satisfied customer.

In the past PAQUET FURS have been sold through the leading Fur Stores of Canada. The demand has now reached a point where more adequate distributing facilities are an absolute necessity. For this reason we have decided upon this new policy of selling direct to YOU at actual wholesale prices. This will enable us to keep our immense Fur Factory running at full capacity all the year round. It will also enable YOU to buy your Furs at the lowest prices ever known in Canada.

Examine them FREE

You don't need to send one cent in advance. Choose your Furs from our 80-page Fur Catalogue and we will send them PREPAID, for Free Examination to any Express Office in Canada. Pay the Express Agent our Catalogue Price and they are yours.

The Set Illustrated, $25.00

No. 6145—Lady's "Olympic" Stole in Black Russian Lynx (perfect imitation of genuine Black Lynx,) lined with plain Satin, Special - - $12.50

No. 2102—Lady's "Teddy" Muff to match, Black Russian Lynx, Satin lined, Special - - - - $12.50

He was taller than she, and his hand some head was bent a little toward her interestedly, as he waited to hear what she had to te,l.

"First of all, I must tell you my great news, Tom. The Rector is going to be married."

Courtney stood still and gave a long whistle.

"No? I always imagined he was of a different mind about women, and that he thought marriage a sin for a pason," he said facetiously.

"I believe he held an opinion of that sort once, but he's given it up. He's going to be married to Miss Revell of Colchester in a month's time."

"Miss Revell of Colchester: Who's she?"

"A lady he met abroad. Yes, it has been a little hurried."

"Like mine was. Tell the Rector he mustn't make no mistake. You see, matrimony's like this: you can't get out unless Death steps in, and then it's ghastly business whether you care for the woman or whether you don't. It leaves a bad taste in the mouth. He ought to be warned in time."

"I'm afraid it's too late. Well, this is going to make a difference to me, of course. There can't be two mistresses in the Rectory. I'm out of a job, Tom, and if you'll take me to the Court Farm I promise you I'll look after you and Robin and Billy to the very best of my ability, and I won't get in your way either. I've been trained in the school of common sense."

Courtney stood still in the road staring incredulously.

"Well! I'm blessed! You mean what you say, Miss Jane? You'll actually come to Court Farm and look after a miserable devil like me, knowing what a temper I've got and all the rest?"

"Yes, I do mean it. I'm not afraid of your temper, and perhaps I'll help you to be less miserable. I promised Emmy I'd see to things if I could, but I didn't exactly expect that I should be able to take it over

Suffered From Her Heart, Could Not Stand Hard Work

Mrs. Harry Smith, 31 Eagle Ave., Brantford, Ont., writes:—"I have suffered with my heart a great deal, and could not stand any hard work. I was doctoring with the Doctor and he told me I had to stop doing anything, but, however, a friend told me about your Milburn's Heart and Nerve Pills, so I got a box and tried them. I had to take several boxes before I felt any benefit, but after doing so I found they were beginning to help me so I continued their use and am now in a position to do all my own work, which I felt I would have to give up."

Milburn's Heart and Nerve Pills are a specific for all weak run down women, whether troubled with their heart or nerves, and if you will only give them a trial we can assure you that they will have the desired effect.

Price 50c. per box or 3 boxes for $1.25, for sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for St. John, N. B., Deep Water Wharfs," will be received at this office until 4.00 P. M., on Wednesday, September 20, 1911, for the construction of a series of Wharfs in the Harbour of St John, at St. John West, N. B.

Plans, specification and forms of contract can be seen and forms of tender obtained at this Department and at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N.B., Geoffrey Stead, Esq., District Engineer, Chatham, N. B., A. R. Decary Esq., District Engineer, Post Office, Quebec, J. L. Michaud, Esq., District Engineer, Montreal, J. G. Sing, Esq., District Engineer, Confederation Life Building, Toronto, and H. J. Lamb, Esq., District Engineer, London, Ont.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, and places of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered back, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into o contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 26, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for Supplying Coal for the Dominion Buildings," will be received at this office until 4.00 P. M., on Tuesday, September 26, 1911, for the supply of Coal for the Public Buildings throughout the Dominion.

Combined specification and form of tender can be obtained on application at this office

Persons tendering are notified that tenders will not be considered unless made on the printed form supplied, and signed with their actual signatures.

altogether. Shall I come, then? May I consider myslf engaged?"

Courtney laughed a queer nervous laugh.

"I didn't think," he said, "when I stepped out of the farm to-night, feeling that I didn't care what happened me, that I'd happen on this. Come and welcome! This is the best bit of luck that has come in Tom Courtney's way for many a long day."

(Continued next issue.)

The Garden Girl.

In my day we were just plain girls and fixed our hair and formed our opinions each according to her own special taste. We had no types. But I have a girl of my own who belongs to a class. She is a garden girl.

She does not sit by a sun-dial in pensive attitude, or clip roses with big shears, in garden gloves and a picture hat, or place dried rose-leaves in Japanese jars with dainty fingers. Rather you should see her at early morning kneeling on the ground, back bent over the garden beds, pulling weeds before the sun waxes too hot. In the forenoons you will find her with hammer and nails and posts and wire netting, protecting her garden from undesirable out-influences. And in the afternoons she is gathering bowlfuls of fresh young lettuce for the hard-worked boarding house keeper at the corner, bunches of smiling nasturtiums for the children of the tenements, a handful of mignonette for a sick chum, or a little boquet for our supper-table.

And when the sun goes down she is watering the garden. Not an exasperating little sprinkle to keep the garden from looking thirsty, but a generous deluge whereby the beds become islands of damp greenness and the tiny walks between, silvery canals in which a fortunate small brother may wade ankle deep.

Finally, when the day is done, and the hose is dragged down into the cellar, wound into a snaky ring and hung upon its nail—all of which is a vast labor—my garden girl sinks down into a chair on the porch like a child wearied of play.

The Danger of the Common Roller Towel.

Yet another article has fallen under the doctor's ban as a menace to public health. This time it is the roller towel, whose favorite haunts are public lavatories and the common washing rooms of the cheaper kinds of lodging houses, schools and other public buildings.

Attention has been drawn to the dangers arising from the microbe-transferring properties of such towels by the action of the Kansas state board of health, which is about to issue an order abolishing the use of roller towels in all public lavatories.

"There can be no doubt that common roller towels are a real menace to health," a well known doctor told the Daily Sketch. "Skin diseaes are particularly easily transmitted in this way, and the danger of other complaints being passed on from one person to another is constantly present. The system in use in the public lavatories provided in the streets, where for a charge of 2d, a wash and brush-up including the use of a clean individual towel is provided, is very satisfactory but the expense would be very heavy if this plan were adopted in schools.

It might be possible to supply individual paper towels, but hitherto

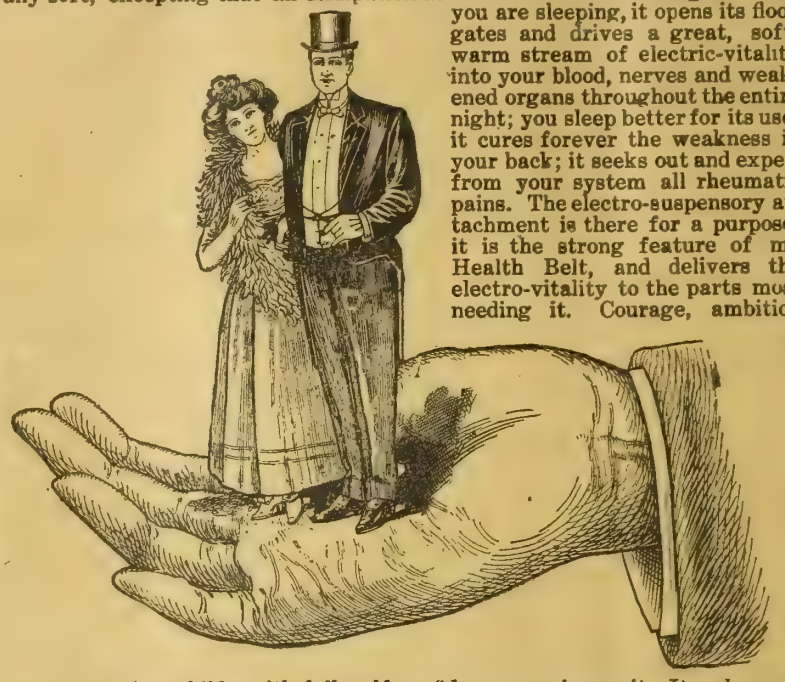
"I Present to You a "Health Belt Man."

He is 55 Years "Young."

Yes, 55 years young; not 55 old for my Health Belt poured vitality into his blood, nerves and tissues until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerves and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition



and a new view of life, with full, self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

These Wonder Books are

Cooling Draughts.

There are a large variety of cooling drinks that may be made at home quickly and inexpensively, and to suit all tastes. The best way to allay thirst is to sip slowly, when a given amount of liquid will do far more good than if drunk quickly.

Appleade.—Bake 6 apples with their skins on; put them into a jug and pour over them 1 gallon boiling water. Cover closely until cold, then sweeten to taste and strain. Ice before serving.

Barley Water.—Wash 1 oz. pearl barley, first in cold water and then in hot, and put on to heat with one quart water. Let boil from ½ to 1 hour, then strain, add sugar to sweeten, and flavor to taste with lemon juice.

"Bomba", an Italian Drink.—Blanch 4 oz. sweet almonds and pound to a smooth paste, adding a few drops of fresh lemon juice during the process to prevent their oiling, then add an equal weight of fine white sugar. When perfectly smooth, add very gradually 2 quarts warm water, stirring briskly all the time, and when cold strain carefully.

Chocolate and Egg Milk Shake.—This is a very nourishing beverage, especially excellent for children. The chocolate syrup may be made and kept on hand for use at any time. Melt 4 squares unsweetened chocolate and add 1 3-4 cups of sugar and a pinch of salt, then pour on gradually, while stirring constantly, 1½ cups boiling water. Stir until smooth, bring to boiling point, and let boil for 5 minutes. Cool, turn into a jar, and keep in the icebox to use as needed. For the shake put 2 tablespoons finely crushed ice in a shaker, add 2½ tablespoons of the syrup, 1 well-beaten egg, and scant 3-4 cup milk. Shake thoroughly, and strain into a glass for serving. Add a grating of nutmeg or a few grains of cinnamon to the top, if liked. If the ingredients have been previously well chilled, the ice may be omitted.

Cream Soda.—Mix together 1 lb. sugar, 1 pint rich cream, 1 quart of water, 1 tablespoon vanilla, and ½ oz. tartaric acid. Bring slowly to a boil, let boil for a moment or two, then put into jars. Use 1 tablespoon of this with ½ teaspoon soda to a glassful of cold water.

Effervescing Lemonade.—Drop 30 drops of lemon onto 1 pound sugar and mix well, then sift fine 2½ ozs. each of tartaric acid and carbonate of soda, and mix with the sugar. Place in air tight bottles for use. Two teaspoons of this should be added to a glass of water, for lemonade.

Egg Lemonade.—Make a tart lemonade, then take as many eggs as you used lemons and beat them until very light, adding ½ cup powdered sugar for about 6 eggs. When thoroughly light, pour them into the lemonade, stirring well.

Fruit Punch.—Boil together 1½ cups sugar and 1 pint water, to form a syrup. Add 1 cup each of cherry juice, red raspberry juice and lemon juice, and let cool. Serve with a little crushed ice in each glass.

Ginger Punch.—Chop coarsely ½ lb. Canton ginger, add it to 1 quart of cold water, with 1 cup sugar, put on the fire in a porcelain or agate saucepan, and let boil 15 or 20 minutes, then add ½ cup each of orange and lemon juice. Strain, and serve very cold.

Jelly Punch.—Boil together 5 minutes 1 cup sugar and 3 quarts water, then dissolve in it 1 pint red currant jelly, and cool. Add 3 lemons and 3 oranges, sliced thin. More sugar may be used to suit the taste.

WHAT! They Need Painting Again?

Let's Buy Amatite ROOFING

It Needs No Painting

AMATITE has a *real mineral surface;* it needs no paint to protect it. In rain and sun and snow and hail, Amatite takes care of itself. It needs no coddling; there is no maintenance cost. You lay it and leave it.

The mineral surface is durable, permanent, absolutely weatherproof, unaffected by climate, insoluble in water, not injured by smoke.

Amatite is easy to lay. No skilled labor is required. You simply unroll it on the roof, and nail it down with nails which we supply to you. Cement the laps with the adhesive cement which we also supply free packed in the center of the roll.

Amatite costs no more than the kind of roofings that require constant painting. You get twice as much weight of roofing for your money as you do with other roofings.

Sample free on request. Address nearest office.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for roofings and all exposed iron and wood.

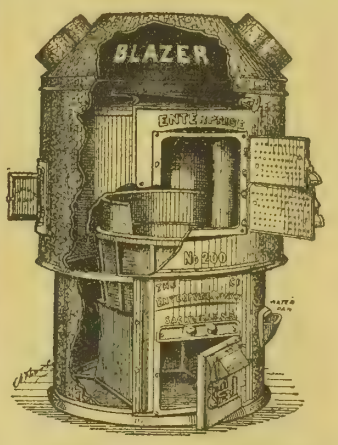
Creonoid *Lice Destroyer and Cow Spray*

Spray the hen house regularly with Creonoid to kill disease germs, repel insects, suppress odors and prevent the spread of contagion. Sprayed on cattle it keeps the flies away, and the cows thus protected produce more milk.

THE CARRITTE-PATERSON MFG. CO., Limited

St. John, N. B. Halifax, N. S.

Have You to Face the Problem



of how to secure the heat required in this climate for practically seven or eight months of the year, and how to get it in the most satisfactory way, with the least trouble and expense?

If so, we can help you solve it by supplying a furnace that will fill the bill, the

ENTERPRISE BLAZER

With Patent Fire Pot.

This we have produced after a great deal of study and experience in catering to the furnace trade, and we feel we have in it a heating apparatus embracing all the best features known in the science of heating by Hot Air.

The BLAZER will burn Hard or Soft Coal or Wood, is made in four sizes and of such height as will adapt it for use in low cellars.

In this space we will show in future issues a few of the many testimonials we have received from the far West from those who have found the BLAZER all we claim for it.

First Aid in Accidents.

Dr. Helen Reynolds Kellogg gives in Woman's Work some valuable lessons in home nursing. Coolness and presence of mind are, Dr. Kellogg says, the qualities necessary to any real help in an accident.

Find out the point of injury, from the patient himself, if able to speak, or from some one near, sensible enough to tell it without superfluous words. If the patient is unconscious, lay him down on his side, with head slightly raised. Loosen tight clothing, sprinkle face with cold water, give a little cold water to drink. Be very careful about forcing stimulants down his throat for fear of strangling. Examine, thoroughly limb by limb for broken bones. If there be bleeding, compress the bleeding temporarily, and remove patient to convenient couch, on no account letting him sit up or try to walk. Send for a doctor and appliance and proceed as follows in certain conditions.

IN CASE OF DROWNING.

If there be little surface warmth when the body is drawn out of the water, or the faintest flutter over the heart, the muscles may be stimulated into action and life be saved.

Put the patient on the side, and lift him up by the legs so that the water may run out of the mouth and air passages. Cleanse the mouth and nostrils from sea-weed and sand; loosen any clothing which confines the chest or abdomen. Cause sneezing, coughing or vomiting by holding ammonia to the nose, bathing face with alcohol, tickling the back of the tongue with a feather, thus starting the circulation.

Failing this, try artificial respiration. Blow air into the the lungs by breathing into the patient's mouth regularly, followed by quick compression on the sides of the chest. Alternate these efforts regularly for fifteen minutes.

Put patient on his back with head slightly over the end of the table. Stand at the head, grasp the arms above the elbow, draw them up till they lie at full length at the side of the head. Keep them there for two seconds, thus pressing the air out of the chest. Continue for a quarter of an hour or until an effort to breathe is noticed, when warmth should be applied to induce circulation.

Strip off the wet clothing, dry the body, using friction with the hand; warm blankets, hot bricks or bottles, corn on the cob boiled, placed in the arm pits and over the stomach and heart, all help. Be very careful to protect the patient from burns.

Give sips of hot milk, tea or coffee and let the patient sleep. Claim has been made that after several hours under water life can be restored by putting the patient in a hot bath, a method worth trial as a final measure.

TREATMENT FOR COLIC.

Colic from eating green apples or other forbidden fruit, may be so intense as to cause fainting, with cold sweats and a feeling that death is near. Give hot salt and water for an ametic, hot applications to the abdominal region, mustard poultice over the pit of the stomach. Don't make the poultice too thin and too strong. Always put a thin cloth between the poultice and the skin. If made with the white of an egg or one-third the quantity of flour it will not blister. Have the patient drink hot water cup after cup, as fast as you can induce him to take it.

REMEDIES FOR CHOKING.

Spasms of the glottis (a part of the throat used in swallowing) is caused by having "swallowed some-

thing the wrong way." A condition of abject terror, increasing every second. Soothe patient if possible, tell him "there is no danger," have him take short breaths and calm down. Sprinkle face with cold water, rub forehead, pat him on the back. If a child, swing him by the heels. Put the finger in his mouth and press on the root of the tongue; it will some times relieve the spasm. This pressure is good for the spasm of whooping cough.

Fishbone in the Throat.—If the curved ends of a fishbone stick in the mucous membrane of the throat, try dislodging it by chewing a crust of bread, and swallowing it as dry as possible, thus mechanically scraping the bone off with it. An emetic of salt and water can be tried. If still annoyed, it must be removed with forceps.

POISON IVY.

The safeguard against this poison, is to learn it, before you touch it. It differs from the harmless Virginia creeper which it so closely resembles, in the number of leaves, or rather clefts in the leaves. The poison ivy has only three leaves while the other has five.

At first there are clusters of minute pimples, changing the next day to blisters, with intense itching, and surrounded with vivid red, lasting from five to ten days.

Washing the parts with a great deal of common, cheap laundry soap has good results. Lime water or soda and water relieves. It protects the surface and prevents itching.

Poisoned wounds from stings and bites from bees and bugs are slight injuries unless irritating substances are carried in with the bite. When the skin around the bite turns black and blue, or has small blisters, call a doctor. Apply cold compresses and zinc ointment for the alleviation of the trouble.

A Pair of Rubbers

The one thing which a woman most dreads—barring, of course, a mouse and being out of style— is a thunder shower. Many most estimable women of character and force, who can lead great crusades and revolutionize society, go all to pieces at a clap of thunder, and a good many men too, for that matter.

It is not agreeable to be struck by lightning. Nor is it at all necessary. There is a sure preventative—as sure as it is simple, inexpensive and always accessible—a pair of rubbers. If a woman will simply put on a pair of rubbers when the lightning begins to flash and the thunder to roar, and will stand on the floor so that she touches nothing else, she will be as safe asfif she were sealed in a glass cage.

Rubber is a non-conductor of electricity, and if the lightning has to go through a sheet of rubber to get at you it will leave you alone and take something else. In other words when you have on a pair of rubbers, and are not in contart with anything you are perfertly insulated.

This is not a theory merely. It is a fact proved by innumerable experiences. A pair of rubbers have saved many a life in a thunder storm.

Freezing the Hair on.

It is reported that Sir Ernest Shackleton recommends extreme cold as one of the best means of strengthening the hair. Almost all that went with him on his Antarctic expedition found that their hair grew thicker and stronger as they approached the pole. It was also found that bald-headed men were almost never found among those who worked for a cold storage company.

A Brief for "Beaver" Flour

"Beaver" Flour

1. Eat more bread made from BEAVER FLOUR and less meat, and you will be better nourished, at the same time reducing the cost of living.
2. No special pastry flour is needed, for BEAVER FLOUR makes the best pies, cakes, biscuits and rolls.
3. It contains the valuable gluten and proteid constituents of Manitoba No. 1 Hard Wheat, but makes finer, whiter bread than if made from that alone.
4. It owes its delicacy and lightness to the carbo-hydrate constituents of Ontario Wheat in just the right proportions, but is more nourishing than if made from that alone.
5. It readily takes up water, and makes larger loaves and more of them.
6. It tickles the palate of the whole family, and does them good.
7. A few good reasons are as good as a thousand, so we will now, Your Honor, rest our case.

Be sure to note that the decision is for BEAVER FLOUR,—
with the costs assessed to those who do not use it.

Diarrhoea Dysentery Summer Complaint

and all Bowel Troubles

Are Curable by the Use of

DR. FOWLER'S Extract of Wild Strawberry

THIS STERLING REMEDY HAS BEEN ON THE MARKET FOR OVER 65 YEARS AND HAS YET TO FAIL TO DO WHAT WE CLAIM FOR IT.

If an unscrupulous druggist or dealer says:—

"This is just as good or better," just say—"Give me 'Dr. Fowler's,' I know what I want when I ask for it, and give me what I ask for."

The price is 35 cents per bottle. See that the name, The T. Milburn Co., Limited, Toronto, Ont., appears on the lable as we are the manufacturers and sole proprietors of this remedy.

Every Woman

is interested and should know about the wonderful

MARVEL Whirling Spray

The new Vaginal Syringe. Best—Most convenient. It cleanses instantly. Ask your druggist for it.

If he cannot supply the MARVEL accept no other, but send stamp for illustrated book—sealed. It gives full particulars and directions invaluable to ladies.

WINDSOR SUPPLY CO.,
Windsor, Ont. General Agents for Canada.

St. Isidore, P. Q., Aug. 18, 1904.
Minard's Liniment Co., Limited.

Gentlemen,—I have frequently used MINARD'S LINIMENT and also prescribe it for my patients always with the most gratifying result and I consider it the best all-round Liniment extant.

Yours truly,
DR. JOS AUG. SIROIS.

BETTER THAN SPANKING

Spanking does not cure children of bed-wetting. There is a constitutional cause for this troub,e. Mrs. M. Summers, Box 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

It will pay you to start your letter with the words: "I saw your advertisement in The Maritime Farmer."

FLORICULTURE

Ferns, St. John, N. B., writes: Can I transfer Rock Ferns this early? I have a shady spot among some rocks that seems to be an ideal place for ferns. What soil would you advise using? Is the woods soil necessary?

Ans.—You can safely transplant your ferns in September, if not too warm. After the middle of the month is usually quite a good time. It is not necessary to use wood soil, any good rich sandy soil is all right. Be very particular about packing the roots solidly into the earth when planting.

H. A., St. John, writes:— My Dahlias and Sweet Peas have been badly broken down by the high winds the past week. The Sweet Peas are probably not beyond repair but the Dahlias are nearly broken off close to the ground. We straightened them up but the tops practically all wilted. Are they worthless for this season, anh do you think the bulbs are destroyed? What can I do to save the roots?

Ans. I do not think that your Dahlia tubers will be destroyed by the damage mentioned. You may lose a few, but there will be enough shoots come up between now and time to dig them to save the vitality of the tubers. Cut off all broken and wilted stalks. They will never amount to anything and will interfere with new growth. Of course, as far as bloom goes, your season is over.

St. Andrews, writes: Will you please advise me about the following: I am told that in buying a fern for a jardiniere in my parlor, that I should get a variety of the Whelmani Fern. Are they as easily grown as the Boston? I know that this sort is pretty and would like the best and hardiest. How tall should such a plant be that could be grown in a pot eight inches across the top?

The Whelmani and Superhessima are both preferable to the Elegantessima, which they have superseded in up-to-date greenhouses. They are as easily grown as a Boston and are much more admiredf A plant of either of these ferns grown in a greenhouse occupyimg an eight inch pot would be of a good specimenn, three feet in diameter from top to top.

Westfield writes:—I am sending some samples of Sweetpea buds to ask if you can explain, if possible, the cause of their growing like this. Only a very few mature and then perhaps with only one blossom on the stem. For some time the buds turned before they had grown out at all, then they seemed to recover and become almost normal and now they have gone off again so that it is difficult to get any bloom at all. What can I do?

Ans. I would suggest the use of liquid cow manure. Ill-nourished Sweetpeas are very apt to blight. The vines may look all right and yet the plants lack enough vitality to produce their flowers. It is hard to advise without knowing the exact local conditions, but buds looking like the samples are frequently seen on ill nourished plants. If the soil lacks potash it will produce the same results. Drought will also produce failures.

Moncton, writes: I have a large elm tree that is becoming covered with web in which are small, hairy worms. How can I destroy them? The rose bushes in my garden are turning brown, and the leaves look like skeleton leaves. How can I save them. Please tell me the name of the old fashioned garden plant, the leaf and flower of which I en-

" Mr. Farmer, if some steel shingles are as leaky as the guarantee behind them, they're not worth the cost of labor in laying them. Stick to 'The Eastlake.' "—
The Philosopher of Metal Town.

You can build cheaper than ever before—you can make your farm buildings weather proof for all time with —

"METALLIC"

Lumber is of inferior quality now-a-days. Why pay high prices for it when you can cover your buildings with "Metallic"?

Galvanized sheet steel is the most desirable building material known, and "Metallic" is the heaviest and toughest made.

By actual test "Metallic" has proved itself the best material for roofing and siding. Roofs covered with "Eastlake" Metallic Shingles 25 years ago are in perfect condition to-day—absolutely lightning, wind, rain, snow and rust proof.

Look over this list, check the items that interest you, clip list and mail, with your name and address to us. We will give you valuable information that will save you money.

"EASTLAKE" METALLIC SHINGLES—for all buildings.
"METALLIC" ROCK FACED STONE OR BRICK SIDING—makes an artistic house.
"METALLIC" CEILINGS AND WALLS—most sanitary interior decoration.
"MANITOBA" STEEL SIDING—for grain elevators.
CORRUGATED IRON—for barns, implement sheds and stock buildings.
"Metallic" Granary Lining—easy to lay. Protects the grain from rats, mice and other vermin.

On receipt of your name we will mail you our interesting illustrated booklets, "Eastlake Metallic Shingles" and "Interior Decoration in Metal." Write to-day.

Grand Trunk Railway System.

GRAND TRUNK RAILWAY SYSTEM ROUND TRIP HOMESEEKERS' EXCURSION TICKETS to Western Canada via Grand Trunk Double Track Route to Chicago, etc., on sale Tuesday, April 4th, and every second Tuesday thereafter until September 19th, at very low fares.

SOME OF THE FINEST FARMING COUNTRY IN THE WORLD is to be found along the line of the GRAND TRUNK PACIFIC in the Provinces of Manitoba, Alberta and Saskatchewan. Descriptive literature with beautifully engraved maps, and giving full information about FREE HOMESTEADS and how to obtain them free, can be had at any G. T. R. Ticket Office.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Low Water Wharf at Pleasant Hill Road, Parish of Kars, N. B.," will be received at this office until 4.00 P. M., on Monday, September 25, 1911, for the construction of a Low Water Wharf at Pleasant Hill Road, Parish of Kars, Kings County, N. B.

Plans, specifications and form of contract can be seen and forms of tender obtained at this Department and at the offices of J. K. Scammell, Esq., District Engineer, St. John, N. B., G. Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Evandale, King's Co., N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent. (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 26, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

If you knew of the real value of Chamberlain's Liniment for lame back, soreness of the muscles, sprains and rheumatic pains, you would never wish to be without it. For sale by all dealers.

close?

Ans. Your Elm tree is infested with tent caterpillars, which spin the web mentioned. At sunset they are all in this web when it should be cut off and burned. The rose slug is causing the damage to the foliage of your roses. Sprinkle them with German hellebore, one tablespoonful to a watering can full of water, stir well when using. A bright sunny day is best. The hardy perennial is the Aconite or Monk's hood, a very poisonous plant and should never be grown where little children can get at the leaves. Better destroy it and get Larkspur which is equally pretty and is quite safe.

The Aster disease is rather bad in some sections this year. The writer saw a very bad case in Chatham recently. The Asters shriveled up without any apparent cause. There is no known remedy for this trouble. It is infectious and plants showing signs of this trouble should be burned promptly and the ground limed. It will even spread from bed to bed, the spores apparently being carried through the air.

For green lice on Sweetpeas or other succulent plants use tobacco water. Get tobacco stems from the factories and steep them in hot water.

Try strong brine on the Mignonette and cabbage worm—a very small quantity is sufficient—if too much is applied to the soil it will kill the Mignonette.

Nine-tenths of the windows used by flower lovers for their plants are too crowded. Remedy this at once. Throw out all leafless scrubs that you have been trying to coax alang for a year or more. It will be better for the plants that remain and the window will be more sightly.

Keep your plants perfectly clean. Begonia leaves that cannot be washed should be lightly brushed every day with a soft duster. Everything else should be sprinkled—three times a week is none too often.

Don't be afraid of water on the foliage of plants that are capable of being washed. Don't forget that the leaves of the plants are its lungs and should be kept clear of all dust or anything that would choke them. Besides these clean plants are not a healthy place for insects. The more the plants are neglected, the more the insects thrive. Keep all the dead leaves picked off and the soil loose on top. The hard crusts that form on the surface of a pot are very injurious to the roots as it prevents the admission of air and sometimes of water. If allowed to remain in a caked condition for a length of time, it becomes solid for some depth and the water cannot get through and although watered every day the plant finally dies from want of moisture.

Do not grow one-sided plants—turn them frequently and if a branch grows too long to make the plant look shapely nip it off. Don't be afraid to prune rapidly growing plants; it does them lots of good.

To Sweeten a Well.

One of our Saskatchewan subscribers, into whose well there has fallen some gophers, writes asking what he may do to help sweeten the well, it being possible for him to pump out the water but not to clean out the well otherwise. We forwarded this query to Frank T. Shutt, Dominion Chemist, Central Experimental Farm Ottawa, whose reply is as follows:—

"We should be inclined to try putting in a considerable quantity of good quicklime, after pumping the well fairly dry. In this suggestion, we have assumed that the bore of the well is such as to allow of the introduction of lumps of considerable size

The First Step In Scientific Farming Is An I H C Manure Spreader

YOU will never get the most out of your soil until it is properly fertilized. And it will never be properly fertilized until you use a good manure spreader, because the use of a spreader will enable you to overcome the practice of spreading on one acre what should be used on two. Why delay the profits that are rightfully yours? Why not look into this manure spreader proposition at once? Learn the many reasons why thousands of other progressive farmers are having such great success with I H C Manure Spreaders.

When you examine one of these spreaders, note the extreme simplicity and great strength of the working parts; note that the beater driving gear is held in a single casting, thus there is no binding nor cutting of parts caused by the gearing springing out of alignment. Notice the roller bearing support for the apron which reduces the draft of the machine; operate the convenient levers; notice how quickly and easily the feed changing device can be shifted, and the wide range of adjustment.

Corn King Cloverleaf

Each of these famous I H C Spreaders is simple, strong, and durable in every part. Each is instantly adjustable to spread light or heavy as your judgment tells you is best for the soil. Whether you have a large or small farm, or whether you want a spreader for orchard use—there is an I H C that will suit your requirements.

Why not see the I H C local agent at once? Let him tell you why I H C Spreaders are so remarkably successful. Get catalogues from him, or, if you prefer, write nearest branch house for any information you desire.

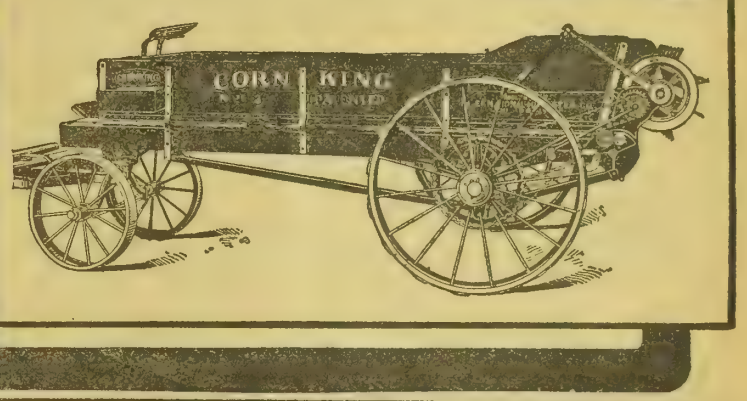
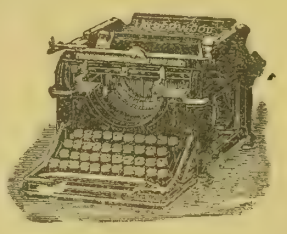
The Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.



Why Every Breeder should Have a Typewriter.



After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

United Typewriter Co., Ltd..

Prince William St., - St. John, N. B.

and that the pipe reaches practically to the bottom of the well. The treatment might be repeated at the end of say a fortnight, first pumping out the well. Other chemicals might be used in the place of the lime, but nothing suggests itself that would be more effective and at the same time safe and cheap.—North West Farmer.

Nova Scotia Crops by Prof. M. Cumming, Agricultural College, Truro, N S.,

Summer, 1911.

The season of 1911 is in some respects the reverse of 1910. Last year was rainy, with luxurious crops of hay and oats and an unusual scarity of fruit. This season is remarkably dry, with the promise of a record crop of apples, well matured and free from spot, a hay crop slightly below the average, and fair crops of oats and other cereals, potatoes and roots.

The weather was cool and wet unti, the end of the first week in May and the seeding season in general opened from one to two weeks behind the usual time. The dry weather of May allowed seeding operations to be carried on practically without interruption, so that by the first of June the farmers were, at least, as far ahead as at the corresponding date in the previous year. During the first three weeks of June, there was abundant rain and all crops that were started by this time promise fully average yields. Since about the 20th of June, the weather has been very dry, more especially in the counties of Digby, Annapolis, Kings, Lunenburg, Queens and Shelburne. Recent rains have broken the spell and it only remains for a continuance of these to make 1911 another of the really good years for the farmers of Nova Scotia.

CROP RETURNS.

The returns upon which the present crop estimate is made arrived at this office on or about July 10th, during the period of dry weather. Several correspondents, whom we have seen, state that recent rains would lead them to put a considerably higher estimate, especially upon the grain crops, root crops and potatoes. Altogether, 128 correspondents, representing all the counties of the province, have contributed to this report. While there is considerable variation among the individual reports, yet the average figures derived from these reports for the various counties are in marked agreement.

HAY—ESTIMATED YIELD.

Compared with 1910, Upland 76, Intervale, 87; Marsh, 78.

Compared with average crop, Upland, 82; Intervale, 94; Marsh, 81.

Compared with 1910, the present year's hay crop seems light, but it must be remembered that the hay crop of 1910 was 8 per cent. above average. During May and early June the outlook for the hay crop was very unfavorable; but the rains of June brought up the yield to a wonderful extent. The subsequent warm, dry weather caused the hay to mature about a week earlier than usual and has resulted in a somewhat lighter crop than was expected at the end of June. In the following counties the yield is below the above estimate: Digby, Annapolis, parts of Kings, Queens, Shelburne, and the northern parts of Cumberland and Colchester. In the remaining counties the yield is either up to or above the fore-going estimate, the best prospects being in the eastern counties. Unfortunately clover is generally reported to have been considerably winter killed. Compensation for the slight shortage in the hay crop this year is found in the fact that at least 12 per cent of last year's crop is still on hand.

OATS AND OTHER GRAINS.

Compared with 1910, 94 per cent.

Compared with average, 112 per cent.

The oat crop and other cereal crops while below that of 1910 are distinctly above the average. They are reported below the average only in parts of the following counties; Digby, Annapolis, Kings, Lunenburg and Queens. For the rest of the province the outlook is very promising.

POTATOES.

Compared with 1910, 99 per cent.

Compared with average, 89 per cent.

Only a very few correspondents report an inferior crop of potatoes and these hail mostly from Annapolis and northern parts of Colchester and Kings Counties. On the other hand correspondents from Hants, Pictou and Antigonish report as high as 50 per cent above last year. It is really too soon to forecast this crop, but with present weather conditions holding, it is sure to be a good one. The potato beetle has not been as troublesome as usual. There is an increase of 3 per cent. in the acerage devoted to potatoes.

TURNIPS AND OTHER ROOTS.

Compared with 1910, 90 per cent.

Compared with average, 106 per cent.

It is really too soon to forecast the root crop. For the most part early seeded land gives excellent prospects, but the later seeded areas were seriously kept back, just as they were sprouting by the dry weather. The crop is reported considerably below the foregoing estimate in the following counties: part of Digby, Annapolis, Kings, Lunenburg, Queens, Shelburne and North Colchester. In the remaining counties the crop is either up to or above the estimate, the most promising being from parts of Hants County While the acerage devoted to mangels has somewhat declined, the acerage given over to turnips has correspondingly increased.

INDIAN CORN AND OTHER FORAGE CROPS.

Forage crops are grown in the province mainly for the purpose of supplementing the early summer and the late fall pastures. It would add greatly to the condition of live stock and to the output of dairy products if farmers generally would grow more forage crops tha at present. A notable increase in the amount of forage crops than at present. A Pictou and Cape Breton Counties. In the other counties the acerage remains about stationary. The occasion of the increase in the two foregoing counties is probably the fact of the very large market for milk and milk products, which leads the farmers to make extra effort to keep

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, 22nd September, 1911, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, 2 times per week each way between Coles Island and Forks from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office of Coles Island, Forks and Route Offices, and at the Office of the Post Office Inspector at St. John.

G. C. ANDERSON,
Superintendent.

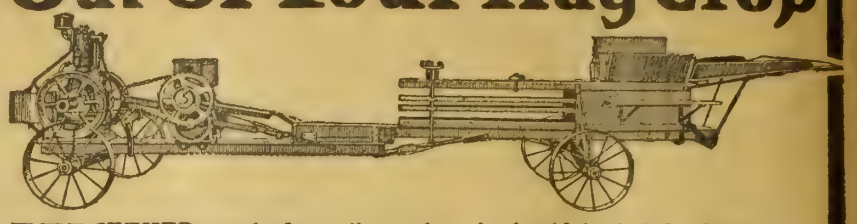
MAIL SERVICE BRANCH.
Ottawa, 9th August, 1911.

How To Get More Out Of Your Hay Crop



WHETHER you feed or sell your hay, it should be baled. Baled hay takes up much less room and nets a better price than loose hay. It is always ready for any market at top price, while loose hay must be sold near home, at whatever price you can get.

IHC Hay Presses

have many points of strength, simplicity, and convenience found in no other presses. They are equipped with a compound lever and a toggle joint plunger, which gives them their great compressing power. A 500 pound pull on the sweep of a 16x18 I H C press gives 76,800 pounds pressure in the bale chamber.

The bed reach is only about 4 inches high and very narrow. The bale chamber is very low—easy to reach over to tie the bale.

I H C Hay Presses are operated by horse power or gasoline engine. The one-horse press has 14x18-in. bale chamber; the two-horse press has 14x18-in., 16x18-in., or 17x22-in. bale chamber. The International Motor Baling Press is furnished with 14x18-in., 16x18-in., or 17x22-in. bale chamber and 3, 4, or 6-horse power I H C gasoline engine.

If you examine an I H C hay ress you will appreciate its value as a money saver and money maker.

Call on the I H C local agent for catalogue and full particulars, or, if you prefer, write nearest branch house.

Economy in Feeding.

Good pasture is sweet and fragrant. These qualities are deficient in dry foods, they are essential to ensure thorough assimilation and prevent waste of food. Food not fully assimilated sooner or later impairs the health. During about twenty-five years Herbageum has, without failure, efficiently and economically replaced those essential qualities, and its regular use with all classes of animals is advised. The cost per month for each cow, horse, beeve, hog or for about twelve fowls is not over 15c and for sheep and calves not over 5c. per month each. It is manufactured by the Beaver Manufacuring Company, Limited, of Galt, Ontario.

"Listen, Rose."
Bud reads:
"Madam, your own white hands are the *first* to touch FIVE ROSES.
"For nearly one mile it travels through "hygienic *automatic* processes—more "and *more* spotless.
"Till in a clear *creamy* stream it flows into "clean *new* packages, filled *full-weight* by "infallible machinery—sewed automatically."
"Goodness!" said round-eyed Rose.
Bud reads eagerly:
"Hand-proof, *germ-proof*. Every littlest "bit of machinery is bright—polished like "those piano keys of yours. FIVE ROSES is "healthy flour, wholesome, *none* like it. "*Unbleached*, too."
"Nobody touches *my* flour—but me" said Rose.
Imagine such *purity*—get FIVE ROSES. 11

Five Roses Flour

Not Bleached — Not Blended

LAKE OF THE WOODS MILLING COMPANY, LIMITED, MONTREAL

up the supply.

Owing to the dry weather of July, the forage crop yield is estimated about 6 per cent below that of last year.

PASTURES.

Pastures were slow in starting and were rather poor up to the end of the first week in June. Subsequent to that they are reported from fair to very good. Their condition for the remainder of the season will depend upon the rain fall.

CONDITION AND NUMBER OF STOCK.

There has been a 3 per cent increase in the number of dairy cattle. Beef cattle remain stationery. Sheep have declined 3 per cent. Swine have increased 4 per cent. All correspondents report live stock in extra good condition, due to the abundant crop of the past year, and the extra amount of hay on hand during the past winter.

FRUIT.

Nothing but continued dry weather will prevent Nova Scotian orchards from giving the highest yields in the history of the province. Besides, fruit growers report unusual freedom from Black Spot and are looking to the best quality of apples they have ever produced. Plums and other small fruits are almost a failure. Trees bloomed from ten days to two weeks earlier than usual, almost all being out of bloom by the end of May, and up to the first of July conditions were almost ideal. Since that time, the dry weather has led to considerable dropping of the fruit, especially in the uncultivated orchards. Fortunately, however, both cultivation and spraying have received more attention than ever before. It is reparted that even in the unsprayed orchards there is very little Black Spot. The most serious pest is the Aphis, which by some it is estimated will reduce the crop 10 p. c.

ACKNOWLEDGEMENTS.

On behalf of all interested, I wish to publicly thank those correspondents from the various counties of Nova Scotia who have voluntarily contributed their estimates. I wish also to acknowledge the services of Mr. A. J. Campbell, of the office of Industries and Immigration, who has not not only compiled, but to a considerable extent edited this Crop Report.—M. Cumming, Secretary for Agriculture.

How to Extend a Farm.

How many acres of land have you?

One hundred.

Then you have bought some more

No, I haven't bought any; I haven't had any given to me, I haven't rented any. Still I have one hundred acres.

You had only twenty.

How do you make that out?

Just this way; I bought twenty acres and thoroughly underdrained it and plowed it deep, utilizing every foot of ground twice the depth of former cultivation, making on an average one acre equal to two. That gave me forty acres.

I then fertilized the land so that one acre produced as much as three did before. That made me twenty acres more, the total sixty acres.

Then I practised persistent cultivation which, I can prove, will double the yield of an acre. Twenty acres more, you see, which makes me eighty.

Yes, and now for the other twenty.

The other twenty I got by using the best of seed and by putting brains and system into my work.

And to prove that my farm contained one hundred acres I am willing to compare results with the average hundred acres anywhere.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.
I will mail, **free of any charge, my home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure—**you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourself at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhœa or Whitish discharge, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weakness peculiar to our sex.**
I want to send you a **complete 10 days treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost**, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters**, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness, and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.
Wherever you live, I can refer you to ladies in your own locality who know and will gladly tell any sufferer that this **Home Treatment** really cures all women's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 - WINDSOR, ONT.

The Effects of Spraying.

From all quarters comes the complaint that apple trees are covered with worms which are eating leaves and buds and people are asking what they will do to save their trees. These worms are the ordinary tent caterpillar which is more or less plentiful every year and this seems to be one of the "more" years.

This pest never appears in a well cared for orchard and the demonstration work done by Provincial Horticulturist Turney at several orchards is bringing this very forcibly to the attention of fruit growers near these orchards.

Mr. J. W. Clark, part of whose orchard at Maugerville, is being used for demonstration work by the Provincial Horticulturist, reports that not a worm is visible in his orchard and that on that part where the strong lime-sulphur spray was used before the buds opened that none of the eggs hatched. Other orchardists who have used only the weak lime-sulphur and poison spray before the blossoms opened state that all the caterpillars are dead. Orchards where no spraying has been done are mostly alive with caterpillars that are working serious damage to the leaves and blossoms, and many enquiries as to what is best to do are coming to the Department of Agriculture.

As it is not wise to give a general spray while the tree is in blossom all that can be done until the blossoms fall is to try and kill or remove the caterpillars while they are massed on the limbs by hand, or to spray them with parafine oil in the mass. As soon as the blossoms fall, a spray of lime-sulphur solution in the proportion of one gallon lime-sulphur to eaux mixture, with either 12 ounces 40 gallons of water, or Bord- of Paris green, or 2 lbs. Lead Arsenate to each 40 gallons mixture should be given all orchards to kill caterpillars, help prevent Black Scab and kill the Codling Moth Worm. This spray must be given before the calyx of the blossoms closes up to be effective.

A bulletin by Provincial Horticulturist, A. G. Turney, dealing with the care of orchards and giving full directions as to spraying is just off the press and now ready for distribution. It may be had free, on application to the Department of Agriculture, Fredericton.

Third Dominion Conference of Fruit Growers.

The following resolutions will be submitted for the consideration of the Third Dominion Conference of Fruit Growers by the delegates from the British Columbia Fruit Growers' Association:—

THAT this British Columbia Fruit Growers' Association adopt as a standard apple box for all purposes the box 10x11x20 inches, and that we instruct our delegates to Ottawa to use every endeavor in their power to have the words "For export only" expurgated from the Canadian Fruit Marks Act. Section 325.

That the association recommend that the four basket plum crate be 15 3-4 x 15 3-4 x 4¼ inside.

That the present pear box 18½x11x8½ be the legal size.

That the peach crate be 18¼ x11 3-4 x4½.

That the pear box 8½ x 11x18½ be adopted by this association as a standard box for crab apples.

RUBEROID ROOFING

Trade Mark Registered. Pronounce it RUE-BER-OID.

Costs Least Per Year Of Service.

Reckoned by first cost only, there are many cheaper roofings than RUBEROID.

Reckoned on the logical basis—the cost per year of service—RUBEROID is cheaper than any other roofing, be it shingles, metal, slate, tile, tar or any other prepared roofing.

RUBEROID'S COST per roll is moderate. The cost of laying is very small, as skilled labor is not required. Repairs, while easily made, are seldom needed if the Roofing is properly laid.

RUBEROID'S DURABILITY is due to the Ruberoid Gum with which the high-grade felt base is saturated and coated on both sides. This gum is a compound of our own, tasteless, odorless, not affected by gases or acids, or by extreme heat or cold. Ruberoid contains no rubber, no oil, no tar, no asbestos.

RUBEROID'S PROTECTION is complete. Fire Underwriters' Associations rate Ruberoid "First class" as a fire-resisting roofing, and in actual service for 19 years it has proved its superiority as a weather-proof roofing.

We have some interesting Booklets, full of information on all kinds of roofing—Booklets that will put you in the way of saving money. Write for Booklet G, or better still call at the nearest store where the "Ruberoid Man" is at home and ask the dealer for it.

"SOVEREIGN" SHEATHING FELT is a light-weight Ruberoid that makes the best inter-lining you can get to keep your house or stable warm and dry. Clean, odorless, practically indestructible. Ask for Booklet about it.

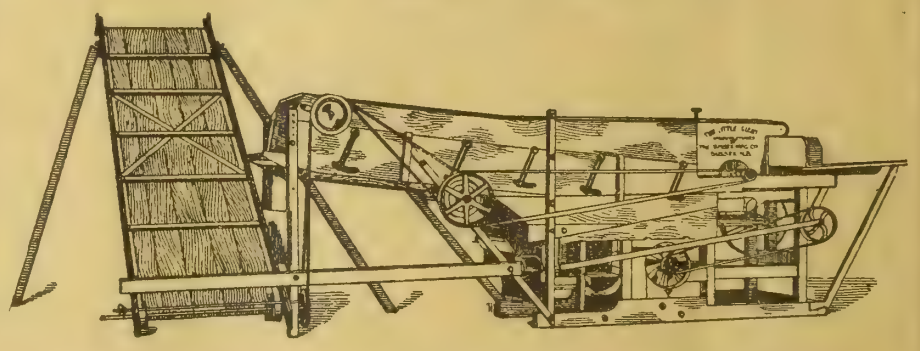
The Best Judge of a Thresher
Is the Man Who Has Used it.

It's not the purpose of this advertisement to tell in detail the merits of the Sussex Little Giant Thresher. This is simply an expression of the opinion of a man who has used it, which is, perhaps, better evidence of its superiority than anything we can say. Should any reader wish a detailed description we will mail descriptive catalogue on application.



Four Horse Thresher may be operated with 5 to 7 H. P. Gasoline Engine.

THE SUSSEX MANUFACTURING CO., Sussex, N. B.

DEAR SIRS:—It affords me much pleasure to write that the Threshing Outfit purchased from you has given entire satisfaction. The nearest estimate I can give as to the number of bushels threshed is 60 bush. of oats in one hour.

I find that the Sussex Little Giant Threshing Machine is far ahead of any other threshing machine I have ever used. I remain, Respectfully yours, E. F. CRABB, Greenwich Hill.

We manufacture the celebrated Little Giant Threshing Machines—the best on the market—in one, two and four horse sizes. It can be supplied with both bagger and tailings elevator, or with either one, at a slight additional cost. Centrally located, as we are in Sussex, we are within easy reach of all parts of the Maritime Provinces and can cater to your wants better than any other Canadian or American firm.

Also in stock—two second hand two-horse Little Giant Threshers, and two two-horse tread powers, slightly used. Also two second hand four-horse machines, slightly used. These machines were taken to be replaced by larger machines, and will be sold at a bargain.

Send for cuts, descriptions, prices and full particulars to-day. All inquiries receive our careful and prompt attention.

THE SUSSEX MANUFACTURING CO., Ltd., Sussex, N. B.

Silver Pine Healing Oil Healed a Barb-Wire Cut without leaving a scratch

MRS. KATE MCCRANE, OF MOWBRAY, MAN., writes:

"Please send me a bottle of your Silver Pine Healing Oil. I had a colt cut last winter with barb wire—I used half a bottle and it healed up and didn't leave a scratch. Now I have another colt that has got cut that I calculate to heal with what is left, but I would like to have you send me another bottle if I should happen to need it, for I think I could not get on without it."

For all kinds of wounds, bruises, burns and sores on animals or human beings, Silver Pine Healing Oil is a quick, safe and wonderful healer. Keep a bottle on hand for times of need. In 25c., 50c. and $1.00 bottles, at your dealer's or from the

International Stock Food Co., Limited, Toronto, Can.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Wharf at Appleby's Wharf, Riverside, N. B.," will be received at this office until 4.00 P. M., on Tuesday, September 26, 1911, for the construction of a Wharf at Appleby's Wharf, Riverside, King's County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of J. K. Scammell, Esq., District Engineer, St. John, N. B.; G. Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Rothesay, King's County, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and place of residence. In the case of firms, the actual signature, the nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, August 28, 1911.

King Cole
TEA
Here is a real tea-treat that will surpass your fond recollection of "the nicest cup of tea I ever tasted"!
King Cole tea will truly make an even nicer cup of tea an everyday reality. Such richness, such vigorous fullness of flavor, such pleasant smoothness were never concentrated so deliciously in your tea-cup before.
And the cup you enjoy a month hence will be as nice as your very first sip. Its delicious flavor never varies. You will love it more and more.
YOU'LL LIKE THE FLAVOUR

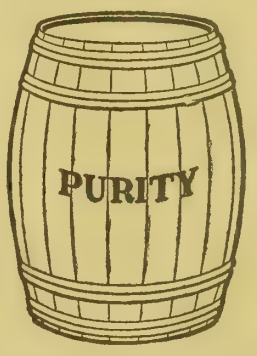
PURITY FLOUR

And Its Keeping Qualities

SOME people find it necessary to buy a considerable quantity of flour at one time—sufficient to last for a long period.

Naturally they are anxious to procure a flour of the kind best adapted to lengthy storage.

There are two important reasons why PURITY FLOUR possesses these qualities. One is that it is made entirely from Manitoba Hard Wheat. The other lies in the fact that the careful milling necessary to produce "Purity" absolutely excludes all low-grade particles of the wheat berry. It's the high grade Manitoba Hard Wheat Flour that keeps—stands longest storage. That's "Purity."



"Purity" flour may cost a little more, but is more than worth the difference. Try it. Watch results both for quality and yield.

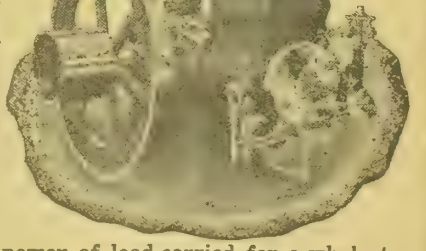
"More Bread and better Bread"

WESTERN CANADA FLOUR MILLS CO., LIMITED

Mills at Winnipeg, Goderich, Brandon.

The "OHIO" Gasoline Engine

is a leader in Simplicity, Reliability, Durability and Economy.



Its igniter is on end of cylinder where it ought to be. To ignite from side of cylinder is wrong.

It valves work vertically, thus doing away with all wear on stem. They never require regrinding as all horizontal valves do.

It is very large for its rated horse power and will carry its load easy without strain at moderate or slow speed.

It is very economical in the use of gasoline, requiring about three-quarters of a gallon for each horse power of load carried for a whole ten hour day.

Governors will control speed wherever set at anything from 75 to 475 R. P. M. and speed can be changed while engine is in motion. Thus the same machine can be used to run thresher, haypress, woodcutter, cream separator, churn, grindstone or water pump.

Prices reasonable—write for catalogue.

No. 865 1-4--Bonita Jumper Fancy

This is one of the "nattiest" sleighs on the road, and at the same time one of the most serviceable. The illustration gives you an idea of the red and green plush upholstering and the fancy attractive nickeled trimmings.

The long runners, extending well behind the seat, make it very easy riding, and the long body gives plenty of room for carrying horse-feed and purchases. If you like to lead the procession, get a Bonita Jumper Fancy. Drop in at the nearest BAYNES Dealer's and see how good it is. Perhaps he will be able to show you some of our other models that will suit you even better.

If you do not know who sells BAYNES Sleighs write us direct. We want live Agents in every unoccupied territory in the East, and our proposition is attractive.

Department of Railways and Canals Prince Edward Island.

BRANCH LINE, CLIFTON BRIDGE, TO STANLEY BRIDGE.

NOTICE TO CONTRACTORS.

SEALED tenders addressed to the undersigned and endorsed "Tenders for branch line Clifton Bridge to Stanley Bridge." will be received at this office until sixteen o'clock on Wednesday, the 20th September, 1911, for the construction of a branch line railway, about three and three-quarters miles in length from Clifton Highway Bridge to Stanley Bridge, Prince Edward Island.

Plans, profiles, specification and form of contract to be entered into can be seen on and after the 4th September at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa; at the office of the Chief Engineer of the Intercolonial Railway, Moncton, and at the office of the Superintendent of the Prince Edward Island Railway, Charlottetown, P. E. I., at which places forms of tender may be obtained.

Parties tendering will be required to accept the fair wages scuedule prepared or to be prepared by the Department of Labour, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $15,000.00 made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
L. K. JONES,
Secretary.

Department of Railway and Canals,
Ottawa, August, 31st, 1911.

Newspapers inserting this advertisement without authority from the Department will not be paid for it.

$3,600 in Cash Prizes for Farmers

ARE you going to build that new horseblock, sidewalk or dairy house of cement? Then insist on your dealer supplying you with the "CANADA" Cement. Not only will this ensure your getting a pure, uniform and strictly high-grade cement, that will guarantee the lifelong permanency of the thing you build, but it will also entitle you to enter our Prize Contest. And in this contest you stand a good chance of winning a prize that will perhaps more than pay you for the cost of the work. Every farmer in Canada who uses "CANADA" Cement is eligible to compete. Four prizes will be awarded in each Province and these prizes will be divided as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement.
PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement on his farm in 1911 for the greatest number of purposes.
PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement.
PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description, of how any particular piece of work shown by photograph sent in, was done.

Notice how we have purposely planned and imposed certain necessary conditions in order to give large and small users of cement an equal opportunity.

As an illustration of this: In prizes "C" and "D," the quantity of cement used has no bearing whatever on the result. The farmer who sends us the best photograph of as small a thing as a watering trough or a gate post, has as much chance for prize "C" as a man who sends a photograph of a house—and the same applies to prize "D."

Don't hold back from entering because you think you don't know anything about concrete work. It's very simple. Besides, we have a 160-page book that we will send you free on request, which tells you all about concrete and how to make and use it. In this book, you'll find complete instructions for the making of almost everything you can think of in the way of farm utilities, floors, vats, troughs, stairs, posts, etc.

This free book—entitled "What the Farmer Can Do With Concrete"—will not only inform you—it will also greatly interest you. So send for it anyway, whether you intend to try for one of the prizes or not.

The Canada Cement Company, Limited, Montreal, Que.

Please send particulars and book.

Why Plants Wilt.

If you cut a flower off and put it in a glass of water, it keeps its head up pretty well for a long time. If you do not put itnto water at once, it wilts. Why? In the first place, the plant takes up water and keeps stiff and erect. In the second place, it wilts because it can get no water, and what is in the plant soon leaves through the stomata. That is, the water is pumped out by the dry air and with none to replace it, the plant wilts. Water is all that keeps tender plants or tender parts of trees from wilting or collapsing.

Force water through a hose and it has a tendency to straighten out. Cut off the water force and it collapses. This is exactly what happens when a plant fails to get enough water.

Severed grass soon becomes good hay if it is handled right. Try this for a lesson in hay makiag. Cut a handful of clover and put it in the hot sun to dry. Put another handful in the shade where it can't dry out so fast. In three hours see which is the best hay. Take the handful of hay and twist it in your hands. In one case, the sun-dried hay will have brittle leaves and green, juicy stems, while the shade-cured hay will be more thoroughly cured and not be so brittle. It is the best hay and will keep best. Why?

Well, the sun dries the leaves to a crisp the first thing, so they can't pump the water out of the stems. The shade-cured hay had a chance to stay green long enough to quite thoroughly pump the water from the stems through the leaves before they wilted.

So if you want good hay, don't lay it out thin in a hot sun. Better soon rake it into loose windrows so the bulk of it will be shaded and the wind can go through. Any hay will keep if it is cured, so you can't wring any juice out of the stems when you twist a handful.

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General will be received at Ottawa until Noon, on Friday, 22nd September, 1911, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, 3 times per week each way, between Butternut Ridge and Thornbrook, from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Office of Butternut Ridge Lower Ridge and Thornbrook, and at the Office of the Post Office Inspector at St, John.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad, as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

REMEMBER! Reeves Munroe, Consulting Electrical Engineer, Taymouth, N. B.

YORKSHIRE PIGS FOR SALE.—Both sexes, 4 weeks old. FRED E. SHARP, Midland, N. B.

FOR SALE.—Two pure bred rams, 18 months old, also one ram lamb, 6 months old. Apply to M. E. ASA BURPEE, Burton, N. B.

FARM FOR SALE.—At Westchester Station. New house and convenient to station. Apply to J. C. MURRAY, Box 624, New Glasgow, N. S.

Association), calved Feb. 20, 1907; color mostly black; sire Korndike Queen De Kol Butter Boy American No 34800; dam Amanartis De Kol 2d American No 57995. Price $100.00 can be seen at Lonewater Farm, Westfield, Kings Co., N. B. Address letters to R. M. BURDEN 308 Hanover St., Boston.

Meadow Brook Stock Farm.

Chatham, N. B.

Clydesdales, Haeknеys, Shorthorns, Berkshires. Look over our winnings at late Amherst Horse Show and you will be convinced that we have the stock. Send your Pure Bred Mares to be bred

J. B. SNOWBALL COMPANY Limited, Proprietors

JOHN BENNETT, Superintendent.

Nova Scotia Provincial Exhibition.

(Continued from page 817.)

competition in any class, particularly in the pure bred classes. It was seemingly a walk over for the exhibitors in the respective classes.

BERKSHIRES—There was only one solitary Berkshire on exhibition.

YORKSHIRES.—There was some competition in the Yorkshire class as will be seen by the list of winners on another page.

CHESTER WHITES.—H. W. Corning and A. J. Nicholson divided the honors in the Chester White class.

POLAND CHINAS.—Chas. Symes won all the money in the Poland China class with the exception of second prizes on boar and sow, under six months, which went to George Symes.

DUROC JERSEYS—J. E. Baker & Sons had everything their own way with their fat Duroc Jerseys.

GRADE SWINE were shown, principally by butchers and farmers in the vicinity of the city of Halifax and were a fairly presentable lot. The fat hogs and bacon hogs came from the same source.

POULTRY.

There was a large entry of poultry which was comfortably housed in the building previously used for the transportation department. J. P. Landry, of the Poultry Department, College Farm, Truro, acted as superintendent and had every section of his department in ship shape when Mr. A. C. Smith, Waltham, Mass., commenced to judge. There was a large entry of turkeys, ducks and geese. Many of the birds were in poor feather, as might be expected at so early a season, but despite that fact some exceptionally good birds were shown and disqualifications were few and far between. The percentage of inferior birds was very small.

THE PARADE AND DRAWING COMPETITION.

The cattle and horse parades on the track made a fine appearance.

The drawing competition for working oxen and steers took place inside the track and three pairs competed. The first prize was divided between Messrs. Pinkey of Yarmouth, and Tupper, of Tupperville, Annapolis County. Mr. Pinkey's steers, pair, hauled 5800 lbs. on the dray, while Mr. Tupper's oxen broke the chain attached to the dray when moving the same weight.

The attendance was as follows:

	1910.	1911
First day	5,268	1,546
Second day	3,999	3,719
Third day	5,430	3,384
Fourth day	5,424	7,395
Fifth day	7,482	18,115
Sixth day	8,899	6,531
Seventh day	5,105	2,541
Eighth day	1,613	1,921
	43,215	44,912

We notice that some of the Halifax clubs have an apathy towards holding their special fairs during the exhibition week, a feature that has the tendency to draw the interests of the citizens and many visitors away from the exhibition.

To the citizens of Halifax we would say:—

Why set up counter attractions exhibition week? Why not get imbued with the Booster Spirit and help the exhibition instead of putting counter attractions as stumbling blocks in its way?

Intercolonial Railway.

Baddeck Branch Line.

SEALED TENDESS addressed to the undersigned and endorsed "Tender for Alba-Baddeck Branch." will be received at this office until sixteen o'clock on Thursday, October 12th, 1911, for the construction of a branch line of railway from a point on the Intercolonial Railway near Alba to the town of Baddeck, a distance of 22.7 miles.

Plans, specifications and form of contract to be entered into may be seen and full information obtained on and after 15th inst. 1911 at the office of the Chief Engineer, of the Department of Railways and Canals, Ottawa, and at the office of the Chief Engineer, of the Intercolonial Railway at Moncton, N. B.

Parties tendering will be required to accept the fair wages schedule prepared or to be preby the Department of Labour, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $30,000.00, made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
L. K. JONES,
Secretary.

Canard, N. S.

The Danger of the Common Roller Towel

(Continued from page 330.)

paper towels have not proved very satisfactory to Europeans. The Japanese—as is well known—use only paper handkerchiefs, but this custom, admirable as it is from a sanitary point of view, has not found favor among western races.

Inquiry at the London county council offices showed that the roller towels are in use in the L. L. C. schools. Precautions are taken to prevent the use of the towels by a child who is afflicted with some complaint, andwhen necessary, if an epidemic is feared, the roller towels are temporarily withdrawn from use. —London Sketch.

Broad View Farm

offers for sale a few choice Imperial Pekin Drakes, $2.00 each, also a few nice White Wyandotte Cockerels, $1.00 each. Order now.

EGBERT DeYOUNG,
Box 120. Dartmouth, N. S.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Pier at Upper Salmon River, N. B.," will be received at this office until 4.00 P. M., on Wednesday, October 4, 1911, for the construction of a Pier at Upper Salmon River, Albert County, N. B.

Plans, specifications and form of contract can be seen and forms of tender obtained on application at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B., Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Alma, Albert County, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signatures, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

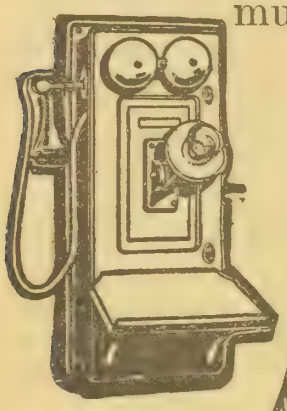
Offering some fine bull and heifer calves sired by Sir Rooker Posch Artis and Helbon Dekol's Prince, from cows and heifers that are producers. Can spare a cow or two bred to freshen next fall. Inspection solicited.

SAMUEL DICKIE, Central Onslow, Col. Co., N. S.

WE SEND THIS 100-PA CLOTH-BOUND VO E SEND US THE COUPON O-DAY FREE

YOU only need to tear out the coupon, fill it in and mail it to us to get this book. "How to Build Rural Telephone Lines" is a stiff-covered, cloth-bound book of 100 pages, crammed full of hard facts about the building of community-owned telephone lines. There is no theory—no clever writing in this book. It is full of nothing but actual facts. It tells the facts about the organization of numerous rural telephone companies and the success they have achieved, the facts you need to know to organize such a company in your own community. The facts about mutual-company organizations and about stock-company organizations, the facts about practical construction work and how you and your own neighbors can do this construction, the facts about the equipment necessary, the facts about government regulations on the matter—in short, it tells you every fact you need to know, from the moment you dream of the possibilities of a telephone system in your community, until the line is actually erected and you are able to talk over it. This is the most complete book of its kind ever published anywhere; it is the one single volume in existence that gives the farmer every detail of information he requires to organize a telephone company and construct a rural telephone line from start to finish.



You owe it to yourself to know all there is to know about rural telephones. Farmers all over the Dominion are organizing companies of their own; if such a company does not already exist in your locality, it is only a question of time until one will be formed and meantime, you should be becomin possessed of the facts.

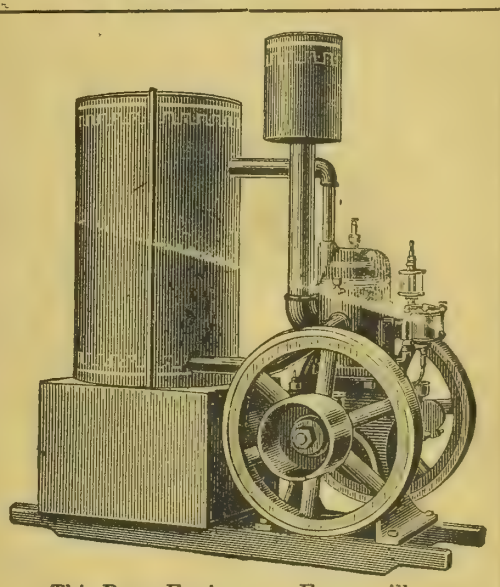
Page Work Engines

Since our first advertisement appeared a month or so ago giving particulars and prices of our engines, we have had many orders. People seem to readily realize that they cannot afford to go without an engine at prices we make—a 3 1-2 horse power at $138. or a six horse power engine for $188. The engines use for fuel either gasoline or kerosene. These engines are powerful but light and can be carried from place to place where work is to be done.

You may be wishing you had an engine to help you do your work, but may be unfamiliar with engines and have an idea that a gasoline engine is an uncertain, complicated thing. If you think so your fears are groundless, for gasoline engines are so developed nowadays as to be just as reliable as any other machine. Anyone can operate a gasoline engine, as there is no danger' No engineer is needed. There is nothing to blow up. Simply put gasoline or kerosene in the fuel tank and give the fly wheel a turn and away she goes for all day. Go off and leave it if you want to. It is safe.

A gasoline engine is started instantly. You do not have to wait to get up steam. When you are through work stop the engine and, and consumption of fuel stops at once. Hence, you can run the engine for only ten minutes, and you use only the fuel required for operating it that length of time.

As to cost of fuel, a Page engine uses only 7-8 of a pint of gasoline or kerosene per horse power per hour. Hence, if you were operating our 3 1-2—4 horse power it would use less than 1-2 gallon per hour, which at 15c per gallon would cost you only about 7 1-2c per hour. Probably you would not work the engine to its limit and fuel would be less accordingly, for a gasoline engine uses fuel only in proportion to the work it is doing.



This Page Engine on a Farm will pump, saw wood, run a cream separator, washing machine, churn, silage cutter, fanning mill, root cutter, grindstone, etc. It may be easily moved from one place to another, and is always ready to run. It does the laborious and tedious chores of the farm.

We are getting many orders from the Maritime Provinces, especially from Prince Edward Island, although Nova Scotia and New Brunswick are not far behind. Dealers find the Page engines a good line to handle as they are so low in price and so high in quality. We are getting so many applications for agency that we hope to have a thorough organization in the engine branch of our business in the near future.

MARINE ENGINES

We have in above referred particularly to stationary or work engines. But we are also supplying marine engines from 2 to 36 horse power. Catalogue of either style on request.

ASEPTO SOAPS Ltd., ST. JOHN, N.B.

Your money back if Purity Flour does not prove entirely satisfactory in the baking.

DON'T simply buy flour from the dollar and cent side of it. Buy high-quality flour. That means PURITY FLOUR. The first little extra cost is more than made up by the extra number of loaves of bread it makes—by the superiority of the bread and pastry in sweetness of flavor and nourishing qualities. Buying Purity Flour is a safe investment. You get large returns, not only on account of Purity's ability to produce more, but because Purity contains the greater nutriment and the vim of a strong hard wheat flour. Food made from Purity Flour gives the consumer health, snap and force, which cannot be gained from the use of the weaker soft wheat flour.

"MORE BREAD AND BETTER BREAD"

PURITY FLOUR

You can buy as little as a 7 pound cotton bag or in 14, 24, 49, and 98 pound sacks. Also in barrels and half-barrels

WESTERN CANADA FLOUR MILLS COMPANY — Purity — MANITOBA HARD WHEAT

Purity may cost a little more than some flours but you'll find its more than worth the difference. To be genuine, must bear the Purity trade mark.

WESTERN CANADA FLOUR MILLS CO., LIMITED
Mills at Winnipeg, Goderich, Brandon

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough — that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

MARITIME WIRE FENCE

What About the Boy Who is to Become a Farmer?

Give Him an Agricultural Education---It is the Best Heritage You Can Leave Him.

The Boy, preparing for Medicine, Law, Theology Literature, Business, etc., must, if he would succeed, have an Education. The Prospective Twentieth Century Farmer should have Equal Advantages.

AGRICULTURAL COLLEGE, TRURO, N. S.

Tuition FREE to All Students from the Maritime Provinces.

Next Session of Full Course Begins November 1st, 1911

Next Shourt Course for Farmers and Farmers' Sons Begins January 2nd, 1912.

Next Short Course in Domestic Science, Dairying, Horticulture and Poultry for Ladies Begins January 2nd, 1912

A farmer's son attending the College, can take a full course in the various branches of Agriculture, Horticulture, Dairying, Poultry Raising, Veterinary Science, etc., and at the same time, in English, Mathematics, Book-Keeping, Political Economy, the various Seiences and other lines regularly studied in High Schools and Colleges.

Requirements for entrance are familiarity with farm practice and an ordinary school education. The College is especially adapted to the needs of farmers' sons who have not had an opportunity to acquire a high school education and now wish to improve their knowledge in all lines.

Students completing the two year course at Truro can enter the third year at Guelph, St. Anne de Belle Vue or any of the American Argicultural Colleges. For full particulars apply to—

The Farm Labor Problem

The two great problems on the farm to-day are time and labor, especially at this time of year when you are gathering in your crops and preparing for the winter months. Wouldn't you welcome a machine that could work away all day, doing your tedious jobs, such as running a cream separator, threshing, cutting corn or pumping water and sawing wood. This is what a

FAIRBANKS-MORSE GASOLINE ENGINE

will do for you, being built for such service and has proved this to over 112,000 users, affording them cheap and reliable help at all times, and any season. Our engines for out-door work are made to run in the coldest day as well as the hottest. Take up your pencil and fill in the coupon and mail it to M

Volume 16. ST. JOHN, NEW BRUNSWICK, SEPTEMBER 26, 1911. Number 24.

The Fredericton Exhibition

THE Fredericton, inter-provincial, exhibition which is bi-annally held under the auspices of Agricultural Society, No. 34, Fredericton, N. B., was held this year on September 16th to 23rd inclusive.

The motto of the managemznt of the Fredericton exhibition seems to be "Watch us Grow Bigger and Better." The 1911 fair easily surpassed any other show ever held in the university town.

The main building which has been enlarged at an expense of several thousand dollars was taxed to its utmost capacity and if the management pursue as aggressive a policy of improvement during the next two years as they have during the past two years no one can afford to miss paying a visit to their fair.

We understand the additions to the main building have been so designed that short courses in live stock judging or a winter fair may be held in them. The new amusement hall will also be used for the annual meetings of the New Brunswick Farmers' and Dairymen's Associations.

The various exhibitors, as in the past, were loud in their praise of the genial courtesy extended to them by Secretary Hooper and the various members of the staff.

The main building was tastefully decorated and the various exhibitors seemed to vie with each other in decorating their respective booths. The large number of excellently arranged booths of the manufacturers' and others was ample proof that Mr. Hooper had not been idle during the past two years.

The amusements were clean and we believe the visitors enjoyed their visit to their hearts content. Disagreeable weather and Federal elections had the tendency to keep the attendance at a lower notch than we would like.

The showing of field and garden roots and of field grains was a sight worth seeing. The tables simply groaned under loads of the products of the farm and garden. Truly the exhibitions of such numerous excellent specimens is an indication that the farmers of New Brunswick can grow as good rops as farmers in any other part of Canada. Mr. S. J. Moore, Maritime representative of the Seed Division placed the awards in these classes.

The showing made in the fruit classes was the best ever made at Fredericton. The apples were well grown and the color was excellent. Mr. Turney, the provincial Horticulturist, who placed the awards in the fruit classes, had a neat, educational exhibit of fruit, showing fruit from sprayed and unsprayed trees. The benefits accruing from spraying was clearly seen in the well grown, richly colored apples while the unsprayed apples were small, wormy, and badly spotted. The fruit used for Mr. Turney's exhibit was taken from an orchard, used by the New Brunswick Department of Agriculture for demonstration purposes. The results achieved by their first season's work would warrant their continuance of the work in various localities.

The Nappan Experimental Farm also had an interesting and instructive exhibit of the products of the farm that was much admired.

Messrs Harvey Mitchell and L. C. Daigle judged the dairy products which were much more numerous than at Halifax. The quality of the butter and cheese, of both creamery and private dairy manufacture, was very good.

The fair grounds have been considerably enlarged by moving some of the stock barns further away from the main buildings than they used to be. This is an improvement that is very much appreciated by the stockmen. Additional stalls and pens have been built for all classes of livestock yet every stall was crowded to its utmost capacity.

THE HORSES.

Horses were not strong in point of quantity but the quality was very good. Mr. Patrick Farrell placed the awards.

THOROUGHBREDS were almost down to the vanishing point. The stallion Cyclist and the imported mare Penela, both exhibited by the Hartland Poultry Yards, were the only Thoroughbreds at the fair.

HACKNEYS—R. A. Snowball had the only two entries in the Hackney Class. He showed Model Peformer in the aged stallion class, Laugton Lily, a Royal show winner in the aged mare class and Laugton Belle and Chatham Lily respectively in the two-year-old and one-year-old classes.

STANDARD BREDS—The first prize on aged Standard bred stallions went to W. Alexander, St. John, N. B., on Dan Gilbert. H. McCoy's Bourbon T. by Bourbon Wilkes and Colombo by Bingen were the second and third prize winners in the same class. Thos. Hughes, Gibson, N. B., and H. Crotty, Fredericton, were exhibitors of Standard bred mares.

COACH HORSES—The Stallions Galloway and Onyx were shown in the Coach horse class by H. C. Jewett and W. Alexander. Galloway captured the diploma for best Stallion any age. Moses Flemming and Miss Vera VanBuskirk had coach mares with foals by Galloway.

IMPORTED CLYDESDALES—There were three entries in the aged Clydesdale Stallions. Jewett's Sorbie Boy, led the way closely followed in second place by F. W. Clark's King of Drumry, a horse imported last winter from Scotland by the late Mr. Thompson. H. A. Treadwell's Provost Wright captured the blue ribbon. Sorbie Boy captured the coveted diploma for best stallion any age. R. A. Snowball, The Fraser Lumber Co., G. Pugh and G. C. Corsar were the other exhibitors of imported Clydesdales. In the aged mare class a Fraser mare, Lady Rose, stood at the head of her class followed in second place by Snowball's Marinetta, by Benedict and in the third place by a good Corsar mare. Fraser's Rosabelle took second place in the brood mare, with foal section while her foal of 1911 by Up-to-Time headed his class. Snowball's Marinetta led the brood mare's class and with her mate May Lothian was at the head of the span in harness class. The second prize in the latter class went to Fraser's Dolly and Lady Rose. G. Pugh had the third prize brood mare.

CLYDESDALES, CANADIAN BRED—R. A. Snowball had the largest entry in this class. His aged stallion, Baron Belgradden was out in fine form but did not meet with competition. In the two-year-old stallion class, Snowblla's Chatham Fame by Scottish Fame took second place to Lee & Clark's Labor Again by Handy Andy. Baron Belgradden snatched the diploma for best stallion any age from all his opponents. Snowball won first, second and third prizes in the yearling filly class with Moss Rose, Mignonette and, Chatham Jennie, while May Lothain's foal of 1911, by Baron Belgradden led his class. G. L. Pugh's foal being placed in second position.

PERCHERONS—The Fraser Lumber Co., H. C. Jewett, D. P. Clayton and Chas. Symes had everything their own way in the Percheron classes. The diploma for best stallion, any age, went to the Fraser Lumber Co., on Ozange, shown in the aged stallion classes. Jewett's Gresham stood in second place. Clayton's imported stallion, Indican was shown in the three-year-old class, while Lord Roberts, shown in the two-year-old class and owned by Chas. Symes had everything their own way in their respective classes. The Fraser Lumber Co., showed the mare Lucette and hitched with her mate Ozange captured first money in the span. Chas. Symes' Distinguee had no competition in the brood mare class.

SADDLE HORSE.—Galloway, H.C Jewett's French Coach Horse was the only entry in the Saddle horse class.

Among other exhibitors in the Roadster, General Purpose and Draught horse classes were F. Burnett, French Village, A. Burnett, Island View, H. Burnett, Kingsclear, H. Crotty, G. S. Parker, B. Goodspeed, Robert Gay, R. T. Baird and G. L. Pugh, who exhibited some very useful horses. Their winnings will be found elsewhere in this issue.

BEEF CATTLE.

were judged by Mr. Gibson, of Ontario. Shorthorns were few in numbers. R. A. Snowball captured all the prizes with the exception of second prize on junior bull calf and third prize on senior and junior bull calves which went to J. R. Jewett, Macniquac and F. W. Clark, Fredericton, respectively.

HEREFORDS—W. W. Black, Amherst, N. S., had no competition against

his magnificent herd of white faces.

POLLED ANGUS.

There were two herds of Polled Angus Cattle exhibited by Messrs A. J. Keniston and E. L. Allen, Bangor Me. They were not top notches and would have stood better fitting.

DEVONS.

Chas. G. and Wm. A. Pinkney of Yarmouth County, N. S. were on hand with their trim herds of Devons and were awarded prizes as will be found in the list of awards.

BEEF GRADES AND FAT CATTLE

The choicest plums in the Beef Grades and Fat Cattle classes went to W. W. Black.

DAIRY CATTLE.

As at the Halifax and Chatham Exhibitions the chief attraction in the stock yards centered on the Dairy Cattle Classes.

Ayrshires, Holsteins, Guernseys, Jerseys and Grades were out in strong numbers. Mr. Glenhenning, of Ontario, placed the awards. While no one doubts that Mr. Glendenning was sincere in making his awards, we are sorry to say that there were cases where his decisions were very unpopular with spectators and exhibitors alike. Many of the Halifax and Chatham decisions were reversed and in some cases animals out-classed at the latter shows mounted to the head of the list at Fredericton. We believe Mr. Glendenning did his best but that is poor balm for the breeders, who spent money and years of usefulness in building up their herds to a high ideal only to find them set back in the show ring and inferior animals set up for models.

We do not mean to infer that Mr. Glendenning's judgment erred in every case, but we do say that the greater number of the stock breeders would not care to again sacrifice the reputation of their stock to his judgment.

AYRSHIRES.

McIntyre Bros., M. H. Parlee, Retson Bros. and Prescott Blanchard exhibited four of the best Ayrshire herds ever shown in the Maritime Provinces. Every class was a whole show in itself, and decisions established at Halifax and Chatham were promuscuously reversed.

In the Aged Bull class, Retson Bros.' Gardrum Prince captured the red ribbon as well as the championship Diploma for the best bull any age. McIntyre Bros.' Whitehill Sunrise, and Blanchard's Spicy Sam came in for second and third places respectively.

Blanchard's Perfection captured the first prize in the four-years-old and upwards cow clas and walked off with the championship diploma. Blanchard also won the first prize on aged herd, followed in second and third places by M. H. Parlee and Mc Intyre Bros. McIntyre Bros. led the way in the young herd contest. They also captured the diplomas for bull and three of his get and cow and two of her progeny on the get of Whitehill Sunrise and the offspring of their popular prize winning cow, White Lady. For the remaining prize winnings in the Ayrshire class see other pages of this issue.

HOLSTEINS.

There were also four strong herds of the ever popular black and whites. Logan Bros. were over from Nova Scotia, and Lea & Clark were on hand from the Garden of the Gulf, to vie with the Brooklands and Wish-Ton-Wish herds owned by Messrs. C. H. Giles and Harding Bros. respectively. As in the Ayrshire class competition was strong in nearly every section of the Holstein class.

Harding Bros.' aged Bull, Schuiling Sir Posch, champion at the Toronto Fairs in 1909 and 1910 went back to his stall as the champion of the Fredericton Exhibition and thus became entitled to the Holstein Friesian Association's Special Prize of $15.00 for best bull any age.

Harding Bros.' Blizzard, winner of first money in the aged dry cow class captured the diploma and the Holstein Friesian Association's Special Prize of $10.00 for best cow, any age At the time of the show, she was only a day or two short of her freshening period and as she carries a well balanced udder of tremendous size, she was much admired by visitors to the Fair. The first prize on aged herd went to Harding Bros. while a similar honor on young herd went to Lea & Clark, whose aged cow, Jacoba Johanna and three-year-old Whilemina were the only two cows entered in the milk test, whose records qualified them for prizes and won the Holstein Friesian Association's Special prizes as well as the prizes offered by the Exhibition in the milk test section.

GUERNSEYS.

Roper Bros. and H. W. Corning had two very nice herds of Guernseys. There were also a few individuals exhibited by Agricultural Society, No. 34 of York Co., N. B. A full list of awards will be found on another page of this issue. The fattest and most coveted plums went to H. W. Corning, among which were the following: Diplomas for champion male, champion female, bull and three of his get and cow and two of her offspring on Island Prince of Hillside and her offspring. Corning also captured the red ribbon on aged herd and on breeders' young herd.

Following is the score made by Lea & Clark's cows in the forty-eight hours milk test:

Jacoba Johanna, 6 years old, 153.8 points, 137.3 lbs. milk testing 3.5 per cent butter fat. Whilemina, 3 years old, 107.4 points, 93.4lbs. milk testing 3.6 per cent butter fat.

It may be added that these cows had been milked out for the beginning of the test immediately after being held up in milk for the show ring. Our readers will understand that the reactionary period that would naturally follow such excitement would not be conducive to large yields and would also cause a variable butter fat per centage.

JERSEYS.

H. S. Pipes & Son, Josselyn & Young and Jas. E. Baker & Sons were the contestants for honors in the Jersey class. Pipes captured the champion male diploma with Fereor while the honor for best female went to Josselyn & Young's Flying Fox's Adora. Josselyn & Young also captured the red ribbon for both aged herd and breeders' young herd as well as the diploma for bull and three of his get with Fox-all of St. John O' Dreamwold and on cow and two of her offspring with their champion cow.

GRADES.

Some very useful dairy Grades were shown by J. C. Gilman & Son, Fredericton, Lea & Clark, Mr. J. Jewett and Roper Bros..

Grade Holsteins predominated. Gilman and Lea & Clark led the way in nearly every class. Lea & Clark had the best female any age and consequently won the Silver Cup donated by the Holstein Friesian Association of Canada for the best grade cow, providing she was sired by a Holstein bull.

SHEEP.

The sheep classes were well filled with the banner flocks of the Maritime Provinces.

New Y. M. C. A. Building, Halifax

Cotswolds, Leicesters, Lincolns, Oxford Downs, Shropshires, South Downs, Hampshire Downs, Cheviots, Dorset Horns and Suffolks made a grand showing and each flock was a credit to its exhibitor. Mr. Gibson who judged the beef classes, placed the awards in the sheep classes. Jas. A. Telfer, of Sussex and the Boswalls of Prince Edward Island had the largest number of entries. The winnings of the respective breeders will be found in this issue. Mr. Telfer held an auction sale of pure bred sheep at the close of the Fair particulars of which will be given later.

SWINE.

Mr. Glendenning judged the Swine classes. The largest number of entries were in the White Chester and Berkshire classes. Chas. Symes and J. E. Baker & Sons had no competition against their Poland Chinas and Duroc Jerseys. Howard Corning B. Goodspeed and J. R. Jewett had some good White Chesters and G. W. Smith, Robert Long and Searle & Lampson had some good Berkshires.

The largest and fattest hog was shown by Mr. A. E. Kilburn.

POULTRY.

Every nook and corner in the Poultry building was crowded with tier after tier of well filled Poultry coops. Almost every variety of domestic birds and fowls, from the tiny canary to the lordly turkey was shown at Fredericton, and there was quality to burn. Messrs. J. P. Landry, poultry manager and instructor at the College Farm, Truro and Seth Jones, poultry expert for the New Brunswick Department for Agriculture placed the awards without fear or favor. Disqualifications were handed out where the dirds did not conform to the requirements of the Standard of Perfection. These gentlemen judge birds as they find them without resorting to any favoritism.

The Poultry Classes at the Maritime Fair are improving year by year and fewer poor specimens are shown now-a-days than used to be a few years ago.

D. Innis, Tobique River, N. B. had the best collection of grain and grain in the straw. Wm . Palmer and W. H. Moore, Scotch Lake had the first and second best eight inch sheafs and bushel lots of cleaned grain from fields entered in the 1911 Standing Grain Competition. Donald Innis had the best selection of grain in the straw. The best assortment of potatoes was shown by Mr. O. W. Wetmore. J. W. Smith had the best collection of garden vegetables, closely followed in second and third places by Messrs. B. Goodspeed and J. Bebbington. Among the exhibitors of Agricultural Products were : D. Curry, G. E. Fisher, J. Stevenson, G. W. Foster, R. Shaw, Wm. Palmer, A. R. Gorham, Wm. Sterritt, M. E. Foster, A. E. Kilburn, N. D. Allen, W. H. Moore, W. L. Mitchell, Jos. McKay, W. Limerick, Miss A. Burkee, C. McFarlane, Fraser Lumber Co., J. W. Smith, Ed. Dumphy, Mrs. E. W. Darcus, A. Schleyer, A. Alward, Boys Industrial Home, T. W. Samson, H. Hayward, Mrs. A. Barker, H. H. Belmore, Thos. Owens, Mrs. Cowperthwaite, C. McFarlane, Mrs. Jos. McKnight, W. E. Seery and S. R. Bolster.

The exhibitors of Horticultural Products were; J. C. Gilman & Son, Robt. Gay, S. B. Hatheway, G. C. Cossar, S. McCullough, Clowes Hallett, R. J. Barker, O. W. Wetmore, A. Dumphy, Chas. Parent, St. John, River Valley Fruit Co., J. Rankine, I. Stevenson, Jackson Bros., F. A. Hubbard, H. D. Almain, H. E. Johnson, A. F. Hiltz, E. Aston, Mrs. E. W. Darcus, W. P. & F. L. Fox, W. Sterritt, John Campbell, F. E. Bailey, Robt. Shaw, Alfred Keene, J. McKilligan, J. S. Neil, Mrs. Sutherland, A. R. Gorham, R. Henry, Cyrus Burtt, Mrs. I. C. Good, Miss Maud Allen, Mrs. M. J. Charters, M. Bower. Such an array of exhibitors all b ut three of whom were from New Brunswick is a fair idea of the interest that New Brunswick farmers are taking in fruit growing.

In closing these remarks on the Fredericton Fair we would say in behalf of the Stock Breeders that if the Management wishes to keep up their policy re larger and better shows it will be necessary for them to secure the services of a competent judge for each and every Dairy Cattle Class, that the boys will return home with their stock feeling that the placing awarded them was correct. Then they will have correct ideals to follow for future guidance.

The "Silver Leaf" Desease of Fruit Trees.

An appeal to the Fruit Growers of Canada for co-operation in preventing the spreading of this alarming trouble.

HOW TO RECOGNIZE "SILVER LEAF" DISEASE.

As the name indicated this disease may be recognized by a silvery or milky gloss on the upper surface of the leaves of Apples, Plums, Peaches, Cherries, Currants and Gooseberries. In this country authentic cases have only occurred on Apples and Plums, but in Europe this disease has often been found in the other kinds of fruits. It is somewhat difficult to recognize the silvery appearance of like "Silver Leaf" but on wiping the leaves, which, however, may become so pronounced as to completely whiten with a kind of bluish white tinge, the foliage of one or more limbs, or often the whole tree. The present use of sprays like Bordeaux or Lime Sulphur results in the covering of the leaves with a bluish or yellowish white film and this may give the tree an appearance not unthe leaves, this covering is of course easily removed, while in the real "Silver Leaf" the colour will remain. Hence it is important to distinguish carefully between these two facts and in order to be sure of the disease specimens will gladly be examined and reported upon by the Division of Botany, Central Experimental Farm, Ottawa. Growers should, however, try to become familiar with the appearance of this disease which is by no means a new trouble in this country, but which has unfortunately escaped detection until the discovery of undoubted cases of "Silver Leaf" in N. S., a few months after taking up my duties here. No doubt every reader is familiar with the silvery foliage of some of our native willows and populars. From a distance these trees may easily be recognized on account of the bluish white appearance of their foliage. If you bear in mind the appearance of this colour when examining your orchards, and if not due to any milky film of sprays there exists the probabilty of the presence of this "Silver Leaf" disease. I again solicit samples of foliage, for we cannot be too careful in taking every possible step to prevent this disease from becoming a source of real danger to one of the country's most important industries.

NATURE OF THE DISEASE.

The "Silver Leaf" is injurious to the life of the trees that have been enumerated. The trees may at first show only one limb affected; gradually another falls a victim, until the whole tree becomes involved. The disease works slowly, and it may take from three to five years before the disease has involved a whole tree This depends naturally upon the size of the tree. During the first few years the affected branches bear some fruit, but bearing soon becomes a thing of the past and the tree dies limb after limb. It may be said that a tree once attacked nearly always dies, and as it is our experience that it bears little or no fruit previous, protection, practically amounts to immediate destruction of the trees which show this disease.

other falls a victim, until the whole tree becomes involved. The disease works slowly, and it may take from three to five yearz before the disease has involved a whole treef This depends naturally upon the size of the tree. During the first few years the affected branches bear some fruit, but bearing soon becomes a thing of the past and the tree dies limb after limb. It may be said that a tree once attacked nearly always dies, and as it is our experience that it bears little or no fruit previous, protection, practically amounts to immediate destruction of the trees which show this disease.

CAUSE OF THE DISEASE.

The cause of "Silver Leaf" in fruit trees has been very much discussed in England and one of the foremost Mycologists of England firmly disputes any disease "theory." His evidence in favour of a physiological disturbance, however, is in the face tion experiments of very little—not of repeated and successful inoculato say of the slightest importance. It is very likely that in many other cases—there exist in this case too, predisposing factors which may be of physiological nature, which render the tree more liable to contract the disease, but there exists in my mind and in that of many careful and reliable investigators (Perciva,, Pickering, etc.) little doubt that "Silver Leaf" has been due to an infection with STEROUM PURPUROUM. This fungus I have found associated with this disease everywhere, where I have traced this disease, moreover reports from other countries (New Zealand, South Africa, etc., etc.), also show that this species of STEROUM is always found where "Silver Leaf" trees exist. Again, in this country I repeated the inoculation last November and every tree thus inoculated now shows "Silver Leaf" quite plainly. Trees inoculated with BJERKANDARA SP, (ADUSTA), (another fungus which frequents dead wood or fruit trees), and check trees made with inoculation cut made with a sterile knife, and finally, those growing in the same row, but where no wound of any kind was made, remained perfectly free from "Silver Leaf" Disease.

WARNING TO GROWERS.

"Silver Leaf" Disease has been recorded and has been personally observed in the following provinces: Ontario (Ottawa only), Nova Scotia (several records), New Brunswick, British Columbia, and Experimental Orchards in Manitoba. No case has yet been recorded from Quebec, Niagara District, or any of the other Provinces where fruit is grown. This must not be taken as an indication of its nonexistence. I have reason to believe that the disease is very widely spread. THE DISEASE IS VERY SERIOUS. Growers in this country are advised to examine their trees very carefully, and give the disease no chance of establishing itself firmly all over the country. THE FRUIT INDUSTRY IS IN REAL DANGER. Without wishing to be an alarmist we cannot afford to neglect the lessons taught us by this disease in other countries, and every fruit grower should unite with the Department in the efforts which are being made to arrest and control the spread of "Silver Leaf".

PRECAUTIONS.

Steroum Purpuroum the fungus which causes "Silver Leaf", is a wound parasite. The fungus is liable to gain entrance through any wound in the bark or root. It produces its fructification on dead wood only, hence its true nature has not at once been recognized. The fructification appears as more or less adpressed or horizontal brackets of a dull crimson colour. Remove at once all trees that are wholly involved—do not allow the stump to remain in the ground. It is generally on the stump in, or lying on the ground where the fructification of the fungus is produced. The whole wood of any "Silver Leaf" tree should be destroyed by fire. Take the trees out any time before fall. In the fall the fructification appear more generally. Cut away and burn any silver leaved branches, and watch the tree, if after cutting away a branch "Silver Leaf" reappears in others throw the tree out. When removing a tree the roots should be dug out also then fill in the hole with stone lime mixed with soil and allow three months before planting another tree in its place. Local infections of single limbs may take place and the inoculation experiments have shown that such a limb may recover, but it is best to remove an infected limb as soon as noticed. The disease is liable to spread from limb to limb, so do not take any risks.—M. Gusson, Dominion Botanist.

Central Experimental Farm,

Street Improvement, Truro

The Cow That Will Come Fresh.

Pregnant cows should be kept in separate lots from all other animals for at least two or three months prior to calving time. A kick or a bunt is very liable to cause abortion, and is sure to weaken the cow's offspring, to say nothing of the distress it must cause the cow herself, she being in such a delicate condition.

Undue exercise, fear or excitement of any kind are to be carefully guarded against, as they not only injure the cow and may cause abortion, but the temperament of the dam will be transmitted to her calf even after birth, and if she be kept in a nervous or frightened condition, ger offspring will be of like temperament, rendering it unfit for dairy or breeding purposes.

While the pregnant cow should be furnished with clean, comfortable quarters and well bedded every night, she should at the same time be allowed plenty of exercise in the open air and sunlight. As the strain on her system becomes greater, she is liable to grow inactive and lazy. Her organs thus become clogged and somewhat dormant, which makes it absolutely necessary that she take daily, gentle exercise. This will loosen all muscles, open the secretive organs, and cause the whole system to work harmoniously and smoothly. Exercise also has a tendency to scatter the congestion in and about the generative organs, throwing some of it off through the bowels and other organs of excretion. Sometimes we find it necessary to move the cows about, in order for them to secure this much- needed exercise, but it must be given if best results are to be realized.

Ice-cold or impure water, and improper grain and roughage are other detrimentals that must be avoided in handling the pregnant cow. Never allow her to drink ice-col water, as it has a most deteriorating effect on her whole system, and while it is very liable to cause abortion, it cannot fail to injure the calf. Water drawn or pumped directly from the depths of a well is about the correct temperature for her to drink; otherwise, it should have the chill removed from it before the cow takes it into her body. Impure or filthy water is even more dangerous than the ice water, and will cause all sorts of serious derangements among the digestive, assimilative and generative organs. For the same reasons, musty or unclean roughage and grain of all sorts should be rejected as rations for the pregnant cow. Over-ripe roughage also contains too much woody material, and will result in dysentary. The above danger will result if too much roughage is given for the amount of grain fed in conjunction with it, and here is where the beneficial effect of the balanced ration will be felt. With clean, bright clover and alfalfa as the roughage portion of the ration, form the grain ration of the milder grains and feed-stuffs; oats, bran, shorts, oil-meal, etc. While we would not eliminate corn altogether, we would advise that it be made only about one-fourth of the ration, as it is apt to produce still more heat in and around the generative organs, where there is already considerable congestion and irritation. The above mentioned amount of corn, however, is not liable to cause any irregularity, but will assist in keeping the animal in better flesh and supplying the necessary warmth for the body. In this connection, it will be well to state that the bowels should be closely watched and kept normal, as they are the surest indicator to the cow's condition. If they become too loose, increase the amount of dry, binding

(Continued on page 880)

Prize Winners at the Fredericton Exhibition.

HORSES.

THOROUGHBREDS.

Stallion, 4 years old and upwards—1 entry, 1st, Hartland Poultry Yards, Hartland, N. B.

Filly or Gelding, 3 years old and upwards—1 entry, 1st, Hartland Poultry Yards.

HACKNEYS.

Stallion, 4 years old and upwards—1 entry, 1st, R. A. Snowball, Chatham, N. B.

Filly or Gelding, 3 years old or upwards—1 entry, 1st, R. A. Snowball.

Filly or Gelding, 2 years old—1 entry, 1st, R. A. Snowball.

Filly or Gelding, 1 year old—1 entry, 1st, R. A. Snowball.

STANDARD BREDS.

Stallion, 4 years old and upwards—3 entries, 1st, W. Alexander, St. John, N. B.; 2nd and 3rd, H. McCoy, Fredericton, N. B.

Filly or Gelding, 3 years old—1 entry, 1st, Thos. Hughes, Gibson, N. B.

Best Breeding Mare—1 entry, 1st, H. Crotty, Fredericton, N. B.

COACH HORSES.

Stallion, 4 years old and upwards—2 entries, 1st, H. C. Jewett; 2nd, W. Alexander,

Stallion, any age, 1st, H. C. Jewett.

Filly or Gelding, 3 years old—1 entry, 1st, Moses Flemming, Scotch Lake, N. B.

Filly or Gelding, 2 years old, 1st, Moses Flemming.

Foal of 1911—1 entry, 1st, Miss V. Van Buskirk, Fredericton.

Brood Mare with Foal by her side—1 entry, 1st, Miss V. Van Buskirk.

CLYDESDALES (Imported).

Stallion, 4 years old—3 entries, 1st, H. C. Jewett; 2nd, F. W. Clark, Fredericton; 3rd, H. A. Treadwell, Maugerville, N. B.

Stallion, any age—Diploma—H. C. Jewett.

Filly or Gelding, 3 years old—5 entries, 1st, Fraser Lumber Co., Plaster Rock, N. B.; 2nd, R. A. Snowball; 3rd, G. C. Corsar, Gagetown, N. B.

Foal of 1911, 1st, Fraser Lumber Co.

Span, Mares or Geldings, in harness, 1st, R. A. Snowball; 2nd, Fraser Lumber Co.

Brood Mare with Foal by her side—3 entries, 1st R. A. Snowball; 2nd. Fraser Lumber Co.; 3rd, G. L. Pugh.

CLYDESDALES (Canadian Bred)

Stallion, 4 years old—1 entry, 1st, R. A. Snowball.

Stallion, 2 years old—2 entries, 1st Lea & Clark, Victoria, P. E. I.; 2nd, R. A. Snowball.

Stallion, any age, 1st, R. A. Snowball.

Filly or Gelding, 1 year old, 1st, 2nd and 3rd, R. A. Snowball.

Foal of 1911, 1st, R. A. Snowball; 2nd, G. L. Pugh.

PERCHERONS.

Stallion, 4 years old—2 entries, 1st, Fraser Lumber Co.; 2nd, H. C. Jewett.

Stallion, 3 years old, 1st, D. P. Clayton. Christie's, N. B.

Stallion, 2 years old, 1st, Chas. Symes, Minudie, N. S.

Stallion, any age—Diploma—Fraser Lumber Co.

Filly or Gelding, 3 years old, 1st, Fraser Lumber Co.

Foal of 1911, 1st, Chas. Symes.

Span, Geldings or Mares, in harness 1st, Fraser Lumber Co.

Brood Mare with Foal by her side, 1st, Chas. Symes.

MILITARY SADDLE HORSES.

1st, H. C. Jewett, Fredericton.

Brood Mare with Foal by her side, 1st, W. Todd, Fredericton; 2nd, Vera Van Buskirk, Fredericton.

CARRIAGE HORSES TO HARNESS

Stallion, 1st, R. A. Snowball; 2nd, H. C. Jewett; 3rd, H. A. McCoy.

Mare or Gelding, 1st, R. A. Snowball; 2nd, F. Burnett, French Village, N. B.; 3rd, H. Crotty, Fredericton.

BEEF CATTLE.

SHORTHORNS.

BULL, 3 years old and upwards—1 entry, 1st, R. A. Snowball, Chatham N. B.

Bull, 2 years old—1 entry, 1st, R. A. Snowball.

Bull, Senior Calf—3 entries, 1st and 2nd, R. A. Snowball; 3rd, F. W. Clark, Fredericton, N. B.

Bull, Junior Calf—3 entries, 1st, R. A. Snowball; 2nd, J. R. Jewett, Macnaquac, N. B.; 3rd, F. W. Clark.

Champion Bull—Diploma—R. A. Snowball.

COW, 4 years old and upwards, 1st, R. A. Snowball.

Cow or Heifer, 2 years old—2 entries, 1st and 2nd, R. A. Snowball.

Heifer, Senior Yearling—2 entries, tries, 1st and 2nd, R. A. Snowball.

Heifer, Junior Yearling—2 entries, 1st and 2nd, R. A. Snowball.

Heifer, Senior Calf—1 entry, 1st, R. A. Snowball.

Champion Female—Diploma—R. A. Snowball.

Aged Herd—1 entry, 1st, R. A. Snowball.

Breeder's Young Herd, 1st, R. A. Snowball.

Bull and 3 of his get—1 entry, 1st, R. A. Snowball.

Cow and 2 of her offspring—1 entry 1st, R. A. Snowball.

HEREFORDS.

All the First Prizes in the Hereford Sections were won by W. W. Black, Amherst, N. S., without competition

POLLED ANGUS.

BULL, 3 years old and upwards, 1st, A. J. Keniston, Bangor, Me.

Bull, 2 years old, 1st, A. J. Keniston.

Bull, Junior Yearling, 1st, E. L. Allen, Bangor, Me.

Bull, Senior Calf, 1st, A. J. Keniston.

Bull, Junior Calf, 1st, E. L. Allen.

COW, 4 years old and upwards—4 entries, 1st and 3rd, A. J. Keniston; 2nd and 4th, E. L. Allen.

Cow, 3 years old—3 entries, 1st, E. L. Allen; 2nd and 3rd, A. J. Keniston.

Heifer, Junior Yearling, 1st, A. J. Keniston.

Heifer, Senior Calf—3 entries, 1st and 3rd, A. J. Keniston; 2nd, E. L. Allen.

Aged Herd—2 entries, 1st, A. J. Keniston; 2nd, E. L. Allen.

DEVONS.

BULL, 3 years old and upwards—3 entries, 1st and 3rd, Chas. G. Pinkney, Melbourne, N. S.; 2nd, Wm. A. Pinkney, East Chebogue, N. S.

Bull, 2 years old, 1st, Chas. G. Pinkney.

Bull, Senior Yearling, 1st, Chas. G. Pinkney.

Bull, Junior Yearling, 1st, Wm. A. Pinkney.

Bull, Senior Calf—2 entries, 1st, Wm. A. Pinkney; 2nd, Chas. G. Pinkney.

Bull, Junior Calf—2 entries, 1st, Wm. A. Pinkney; 2nd, Chas. G. Pinkney.

Champion Bull—Diploma—Chas. G. Pinkney.

COW, 4 years old and upwards—3 entries, 1st and 2nd, Wm. A Pinkney; 3rd, Chas. G. Pinkney.

Cow, 3 years old—3 entries, 1st and 2nd, Wm. A. Pinkney; 3rd, Chas. G. Pinkney.

Cow or Heifer, 2 years old—3 entries, 1st and 3rd, Chas. G. Pinkney; 2nd, Wm. A. Pinkney.

Heifer, Senior Yearling, 1st, Wm. A. Pinkney.

Heifer, Junior Yearling—2 entries, 1st, Wm. A. Pinkney; 2nd, Chas. G. Pinkney.

Heifer, Senior Calf—3 entries, 1st, Wm. A. Pinkney; 2nd and 3rd, Chas. G. Pinkney.

Heifer, Junior Calf—2 entries, 1st, Wm. A. Pinkney; 2nd, Chas. G. Pinkney.

Champion Female—Diploma—Wm. A Pinkney.

Aged Herd, 1st, Wm. A. Pinkney; 2nd, Chas. G. Pinkney.

Breeder's Young Herd, 1st, Chas. G. Pinkney; 2nd, Wm. A. Pinkney.

Bull and 3 of his get—Diploma—Chas. G. Pinkney.

Cow and 2 of her offspring—Diploma—Wm. A. Pinkney.

BEEF GRADES.

W. W. Black, Amherst, N. S. won all the First Prizes in the Grade Beef Classes, without competition except in the Heifer Calf Class, when a second Prize was won by J. R. Jewett.

FAT CATTLE.

All the First Prizes awarded in this Class went to W. W. Black, without competition.

DAIRY CATTLE.

AYRSHIRES.

BULL, 3 years old and upwards—3 entries, 1st, Retson Bros., Truro, N. S.

2nd, McIntyre Bros., Sussex, N. B.; 3rd, Prescott Blanchard, Truro, N. S.

Bull, 2 years old—2 entries, 1st, McIntyre Bros.; 2nd, M. H. Parlee.

Bull, Junior Yearling—3 entries, 1st, Prescott Blanchard; 2nd, McIntyre Bros.; 3rd, Retson Bros.

Bull, Senior Calf—5 entries, 1st, Prescott Blanchard; 2nd, Retson Bros. 3rd, M. H. Parlee, Lr. Millstream, N. B.

Bull, Junior Calf—3 entries, 1st, McIntyre Bros.; 2nd, Retson Bros.; 3rd, M. H. Parlee.

Champion Bull—Diploma—Retson Bros. (Gardrum Prince).

COW, 4 years old and upwards—9 entries, 1st and 3rd, Prescott Blanchard; 2nd, McIntyre Bros.; 4th, M. H. Parlee.

Dry Cow, 4 years old and upwards—1 entry, 1st, M. H. Parlee.

Cow, 3 years old—5 entries, 1st, 2nd and 3rd, Retson Bros.

Dry Cow, 3 years old—2 entries, 1st and 2nd, Prescott Blanchard; 3rd, McIntyre Bros.

Heifer, 2 years old—5 entries, 1st, McIntyre Bros.; 2nd and 3rd, Retson Bros.

Heifer, Senior Yearling—5 entries, 1st, McIntyre Bros.; 2nd, M. H. Parlee; 3rd, Retson Bros.

Heifer, Junior Yearling—4 entries, 1st and 3rd, McIntyre Bros.; 2nd, Retson Bros.

Heifer, Senior Calf—7 entries, 1st and 2nd, McIntyre Bros.; 3rd, M. H. Parlee.

Heifer, Junior Calf, 1st, McIntyre Bros.

Champion Female—Diploma—Prescott Blanchard.

Aged Herd—4 entries, 1st, Prescott Blanchard; 2nd, M. H. Parlee; 3rd, McIntyre Bros.

Breeder's Young Herd—3 entries, 1st, McIntyre Bros.; 2nd, Retson Bros.; 3rd, M. H. Parlee.

Bull and 3 of his get—1 entry—Diploma—McIntyre Bros.

Cow and 2 of her offspring—Diploma—McIntyre Bros.

HOLSTEINS.

BULL, 3 years old and upwards—3 entries, 1st, Harding Bros., Welsford, N. B.; 2nd, Logan Bros., Amherst Point, N. S.; 3rd, C. H. Giles, Fredericton, N. B.

Bull, 2 years old—2 entries, 1st, Harding Bros.; 2nd, Lea & Clark.

Bull, Senior Yearling—1 entry, 1st, Lea & Clark.

Bull, Junior Yearling—1 entry, 1st, C. H. Giles.

Bull, Senior calf—4 entries, 1st, Lea & Clark; 2nd and 3rd, Logan Bros.

Bull, Junior calf—3 entries, 1st and 2nd, Logan Bros.; 3rd, Lea & Clark.

Champion Bull—5 entries, Diploma and Holstein Friesian Association Special Prize—Harding Bros.

COW, 4 years old and upwards—3 entries, 1st, Lea & Clark; 2nd and 3rd, C. H. Giles.

Dry Cow, 4 years old and upwards—7 entries, 1st and 3rd, Harding Bros. 2nd, Lea & Clark.

Cow, 3 years old—2 entries, 1st, Lea & Clark; 2nd, Harding Bros.

Dry Cow, 3 years old—1 entry, 1st Logan Bros.

Cow, 2 years old—3 entries, 1st and 2nd, C. H. Giles; 3rd, Lea & Clark.

Heifer 2 years old—5 entries, 1st, Logan Bros.; 2nd, C. H. Giles; 3rd, Lea & Clark.

Heifer, Senior Yearling —6 entries, 1st and 2nd, Harding Bros.; 3rd, Logan Bros.

Heifer, Junior Yearling—3 entries, 1st and 3rd, Logan Bros.; 2nd, Lea & Clark.

Heifer, Senior Calf—8 entries, 1st, Logan Bros.; 2nd and 3rd, Lea & Clark.

Heifer, Junior Calf—4 entries, 1st, Logan Bros.; 2nd, Harding Bros.; 3rd Lea & Clark.

Champion Female—Diploma and Holstein Friesian Association Special Prize—Harding Bros.

Aged Herd—4 entries, 1st, Harding Bros.; 2nd, Lea & Clark; 3rd, Logan Bros.

Breeder's Young Herd, 1st, Lea & Clark; 2nd, Logan Bros.; 3rd, Harding Bros.

Bull and 3 of his get—3 entries, Diploma and Holstein Friesian Association Special Prize—C. H. Giles.

Cow and 2 of her offspring—3 entries, Diploma and Holstein Friesian Special Prize—Harding Bros.

Holstein Friesian Association's Special Prize for 3 animals the get of one sire—3 entries, 1st, C. H. Giles.

Holstein Friesian Association's Special Prize for 2 animals the offspring of one cow—3 entries, 1st, Lea & Clark.

JERSEYS.

BULL, 3 years old and upwards—2 entries, 1st, H. S. Pipes & Son, Amherst, N. S.; 2nd, Josselyn & Young Silver Falls, N. B.

Bull, 2 years old—1 entry, 1st, J. E. Baker & Sons, Barronsfield, N. S.

Bull, Senior Yearling—1 entry, 1st, H. S. Pipes & Son.

Bull, Junior Yearling—1 entry, 1st, H. S. Pipes & Son.

Bull, Senior Calf—3 entries, 1st, Josselyn & Young; 2nd and 3rd, H. S. Pipes & Son.

Bull, Junior Calf—3 entries, 1st and 3rd, H. S. Pipes; 2nd, Josselyn & Young.

(Continued on page 879)

The Chatham Exhibition

Chatham, on the banks of the beautiful Miramichi, was the scene of great interest and enthusiasim on the evening of Sept. 11th, when the Exhibition of 1911 was opened by Lieut. Governor Tweedie, followed by stirring addresses from Premier Hazen, Hon. John Morrisey, and Mayor Byrne.

Under the able management of its well known Secretary, Geo. E. Fisher, the Exhibition was an assured success from the start, and it was noted with pleasure by visitors that the people of Chatham vie with each other in making their Exhibition a credit to their town, and a delight to strangers.

Weeks of hard work, and the arrival of forty carloads of stock resulted in one of the finest displays of agricultural progress ever seen in the Province, and the management may be congratulated upon the efficient eqipment and means they have provided to make this a banner Exhibition.

The Horse Classes as in all others were a decided improvement both in quality and numbers upon former years, especially in Clydesdales and Hackneys. Meadow Brook Stock Farm coming out with its Clydesdale Stallion "Baron," a splendid type of sire, that is doing a good deal to improve the class of draft horses in the district.

CATTLE CLASSES.

In the Cattle Classes Chatham has never before had such breeding or quality within her Exhibition gates, and it was very noticeable what an improvement was being made along the lines of character and constitution by the Jersey breeders amongst whom the honors were fairly divided.

HOLSTEINS were heavily represented by herds from Prince Edward Island, Nova Scotia, and New Brunswick.

AYRSHIRES too were numerous, the principal herds coming from the Sussex Valley and Truro.

R. A. Snowball was the main exhibitor of Shorthorns, and Messrs. W. A. and Chas. G. Pinkney of Devons.

A feature of the Exhibition was the increased number of Sheep Entries, and that a grander, evener lot was never on the Fair grounds, may be judged by looking over the names of the Exhibitors, and the interest evinced in the different breeds gave the impression that the sheep breeders of this Province are not content to allow their flocks to depreciate.

The entries in Swine were not particularly numerous but here the effort seemed to be "Quality and not quantity", which counts for more than anything else in any class of live stock.

The Agricultural Hall could not be better filled with the fruits of earth and field, and goes to show what the country surrounding Chatham is capable of producing. The good quality that existed in every class as well as the quantity kept the two judges hard at work whilst the Fair lasted.

The Poultry was a great attraction the building being filled with a very creditable display.

The Judges were:—
Horses, Patrick Farrell; Cattle Beef, John T. Gibson; Cattle Dairy, Andrew Elliot; Sheep, Jno. T. Gibson; Swine, Andrew Elliot; Poultry, Seth Jones; Fruit, A. G. Turney; Grain and Roots, S. J. Moore; Roots and Vegetables, C. F. Alward; Dairy, L. C. Daigle.

HORSES.

HACKNEY STALLION—4 years old, 1st & Diploma, R. A. Snowball; 2 years old, 1st, R. A. Snowball; 1 year old, 1st, R. Cox; any age, Diploma, R. A. Snowball.

HACKNEY FILLY OR GELDING—3 years old, 1st, R. A. Snowball; 2 years old, 1st, R. A. Snowball; 1 year old, 1st, R. A. Snowball; Foal, 1911, R. T. Hawkes.

HACKNEY Brood Mare with Foal. R. T. Hawkes.

STANDARD BRED—Stallion, 4 years old, 1st, W. B. Snowball.

CLYDESDALES—Stallion, 4 years old, 1st, R. A. Snowball; Stallion, 2 years old, 1st, Lea & Clarke, 2nd, R. A. Snowball; Stallion, 1 year old, 1st Geo. E. Fisher; Stallion, any age, Diploma, R. A. Snowball; Filly or Gelding, 3 years old, 1st, R. A. Snowball, 2nd, Geo. J. Dickson; Filly or Gelding, 1 year old, 1st, 2nd and 3rd, R. A. Snowball; Foal of 1911 1st and 3rd, R. A. Snowball, 2nd, Jno. O' Brien; Brood Mare with Foal 1st, R. A. Snowball.

PERCHERONS—Aged Stallion, 1st H. L. Graham, Tahusintac; Stallion, 2 years old, Diploma, Chas. Symes; Filly or Gelding, 1st, Jno. A. Mersereau; Foal of 1911, 1st, Chas. Symes Brood Mare with Foal, 1st, Chas. Symes.

Military Saddle Horse, 1st, Geo. J. Dickson.

CARRIAGE HORSES—Filly or Gelding, 1st, M. Galloway; Yearling Filly or Gelding, 1st, R. T. Hawkes; Foal of 1911, 1st, Jno. P. Burchill, 2nd, M. Searle, 3rd, Jas. Creamer.

MEDIUM DRAUGHT HORSES—Brood Mare, 1st, Keating Bros.; Mare or Gelding over 1100 lbs., 1st, Jno. A. Mersereau, 2nd, A. G. Dickson; Mare or Gelding, 3 years old, 1st, R. A. Snowball, 2nd, Keating Bros.; Filly or Gelding, 2 years old, 1st, W. H. Baldwin; 2nd, M. Galloway, 3rd, M. F. Moonan; Foal of 1911, 1st, Geo. Dickson, 2nd, Trappist Fathers; Brood Mare with Foal, 1st, Geo. J. Dickson, 2nd, M. Searle, 3rd, Trappist Fathers; Matched Team, 1st, Keating Bros.

HEAVY DRAUGHT—Mare or Gelding, any age, 1st, R. A. Snowball; Mare or Gelding, 3 years old, 1st, R. A. Snowball; Filly or Gelding, 2 years old, 1st and 2nd, R. A. Snowball; Yearling Filly or Gelding, 1st, Bev. Jardine; Foal of 1911, 1st, R. A. Snowball; Brood Mare with Foal, 1st, R. A. Snowball; Matched Team, 1st, R. A. Snowball.

SHORTHORNS.

BULL—3 years old and up, R. A. Snowball; 2 years old, R. A. Snowball; Calf,1st and 2nd, R. A. Snowball; Calf under 6 months, R. A. Snowball; Any age, R. A. Snowball;

COW—4 years old and up, 1st and 2nd, R. A. Snowball, 3rd, Trappist Fathers.

Cow or Heifer, 1st and 2nd, R. A. Snowball, 3rd, H. McKendy.

HEIFER—Senior, 18 months, 1st and 2nd, R. A. Snowball; Junior, 12 months, 1st, R. A. Snowball; Calf 12 months and over, 1st, R. A. Snowball, 1nd, Trappist Fathers; Calf under 6 months, 1st, Trappist Fathers.

Female, any age, 1st, R. A. Snowball.

Herd Prize, R. A. Snowball.

Breeders young herd, R. A. Snowball.

Bull and 3 of his get, R. A. Snowball.

Cow, and 2 of her offering, R. A. Snowball.

DEVONS.

All Prizes in Devons went to Messrs. Chas. and Wm. A. Pinkney.

JERSEYS.

BULL—2 years old, 1st, Josselyn & Young, St. John; 2nd, H. S. Pipes & Sons, 3rd, M. Searle; 2 years old, 1st, Jas. E. Baker & Sons; 18 mos. old, 1st, H. S. Pipes & Sons; 12 months old, 1st and 3rd, H. S. Pipes & Sons, 2nd, Josselyn & Young; Calf, 1st, H. S. Pipes & Sons, 2nd and 3rd, Josselyn & Young; any age 1st, Josselyn & Young.

COW—4 years old, 1st and 3rd, Josselyn & Young, 2nd and 4th, H. S. Pipes & Sons; Dry, 4 years, 1st, Josselyn & Young, 2nd, H. S. Pipes & Sons; 3 years, 1st, H. S. Pipes & Sons, 2nd and 4th, Josselyn & Young, 3rd, Jas. E. Baker & Sons; Dry, 3 years, 1st, H. S. Pipes, 2nd, Josselyn & Young; 2 years, 1st and 3rd, Josselyn & Young, 2nd, H. S. Pipes.

HEIFER—2 years, 1st and 3rd, H. S. Pipes, 2nd, Josselyn & Young; Senior, 18 months, 1st and 2nd, Josselyn & Young, 3rd, H. S. Pipes; Junior, 1st, H. S. Pipes, 2nd, Josselyn & Young; Calf, 12 months, 1st, H. S. Pipes, 2nd and 3rd, Josselyn & Young; Calf under 6 months, 1st and 2nd, Josselyn & Young, 3rd, H. S. Pipes.

Female any age, 1st, Josselyn & Young.

Herd Exhibitors, 1st, Josselyn & Young.

Herd, Breeders Young, 1st, Josselyn & Young, 2nd and 3rd, H. S. Pipes & Sons.

Bull and 3 of his get, 1st, Josselyn & Young.

Cow and 2 of her offspring, 1st, Josselyn & Young.

HOLSTEINS.

BULL—3 years, 1st, Logan Bros., 2nd, Harding Bros.; 2 years, 1st, Harding Bros., 2nd, J. D. Irving, 3rd, Lea & Clarke; Senior, 18 months 1st, Lea & Clarke, 2nd, J. D. Irving; Calf, 12 months, 1st and 2nd, Logan Bros., 2nd, Wm. M. Johnston; Calf 6 months, 1st, Logan Bros., 2nd, Lea & Clarke; Any age, 1st, Logan Bros.

COW—4 years old, 1st, Lea & Clarke, 2nd, J. D. Irving; Dry, 4 yrs. 1st, Harding Bros., 2nd, Logan Bros. 3rd, Lea & Clarke; 3 years, 1st, Harding Bros., 2nd, Lea & Clarke; Dry, 3 years, 1st, Logan Bros; 2 yrs. 1st, Pea & Clarke; 2 years, 1st, Lea & Clarke.

HEIFERS—2 years, 1st, Logan Bros., 2nd, J. D. Irving, 3rd, Lea & Clarke; Senior, 1st, Harding Bros., 2nd and 3rd, Logan Bros.; Junior, 1st and 3rd, Logan Bros., 2nd, Lea & Clarke; Calf, 1st and 2nd, Logan Bros., 2nd, Lea & Clarke; Calf under 6 months, 1st, Logan Bros., 2nd, Lea & Clarke, 3rd, Harding Bros..

Female any age, 1st, Harding Bros.

Herd Exhibitors, 1st, Logan Bros., 2nd, Harding Bros., 3rd, Lea & Clarke.

Breeders young herd, 1st, Logan Bros., 2nd, Lea & Clarke, 3rd, J. D. Irving.

Bull and 3 of his get, 1st, Lea & Clarke.

Cow and 2 offspring, 1st, Lea & Clarke.

AYRSHIRES.

BULL—3 years and up, 1st, P. Blanchard, Truro, 2nd, McIntyre Bros., 3rd, Retson Bros.; 2 years, 2nd, McIntyre Bros., 3rd, M. H. Parlee, 3rd, Keating Bros.; Senior, 18 months, 1st, Geo. E. Fisher, 2nd, Jno. McNaughton; Junior, 12 months 1st, McIntyre Bros., 2nd, Howard McKendy, 3rd, P. Blanchard; Calf under 12 months, 1st, McIntyre Bros. 2nd, P. Blanchard, 3rd, M. H. Parlee; Calf,6 months, 1st, Retson Bros, 2nd, McIntyre Bros., 3rd, W. H. Parlee; Any age, 1st, P. Blanchard.

COW—4 years old, 1st, McIntyre Bros., 2nd, M. H. Parlee, 3rd and4th, P. Blanchard; Dry, 4 years, 1st and 2nd, Geo. E. Fisher, 2nd, M. H. Parlee; 3 years, 1st and 2nd, Retson Bros., 3rd, McIntyre Bros., 4th, M. H. Parlee; Dry, 3 years, 1st and 2nd, P. Blanchard; 2 years, 1st and 2nd, P. Blanchard, 3rd, Geo. Fisher.

HEIFER—2 years old, 1st and 2nd, McIntyre Bros., 3rd, Retson Bros.; Senior, 18 months, 1st, McIntyre Bros., 2nd, Retson Bros., 3rd, M. H. Parlee; Junior, 12 months, 1st and 2nd, McIntyre Bros., 3rd, Retson Bros.; Calf, 1st, McIntyre Bros., 2nd, P. Blanchard, 3rd, M. H. Parlee; Calf, 1st, McIntyre Bros., 2nd and 3rd, H. McKendy.

Female any age, 1st, McIntyre Bros

Herd Exhibitors, 1st, P. Blanchard, 2nd, McIntyre Bros., 3rd, Retson Bros..

Herd Breeders young, 1st, McIntyre Bros., 2nd, Retson Bros., 3rd, M. H. Parlee.

Bull and 3 of his get, 1st, McIntyre Bros.

Cow and 2 offspring, 1st, McIntyre Bros.

GUERNSEYS.

BULL—3 years old, 1st, Roper Bros.; 2 years old, 1st, H. Corning 2nd, Roper Bros.; Senior, 1st, Roper Bros.; Junior, 1st, Roper Bros.; Calf, 12 months, 1st, H. Corning, 2nd, Roper Bros.; Calf, 6 months, 1st and 2nd, H. Corning, 3rd, Roper Bros.; Any age, 1st, Roper Bros.

COW—4 years old, 1st and 4th, H. Corning, 2nd and 3rd, Roper Bros.; Dry, 4 years, 1st and 2nd, Roper Bros.; 3 years, 1st and 3rd, H. Corning, 2nd, Roper Bros.; Dry, 3 years, 1st, Roper Bros.; 2 years, 1st and 3rd, Roper Bros., 2nd, H. Corning.

HEIFER—2 years, 1st, H. Corning, 2nd, Roper Bros.; Senior, 1st and 3rd, Roper Bros., 2nd, H. Corning; Junior, 1st and 2nd, Roper Bros. Calf, 12 months, 1st, Roper Bros., 2nd and 3rd, H. Corning; Calf, 6 months, 1st and 3rd, Roper Bros., 2nd, H. Corning.

Female any age, 1st, Roper Bros.

Herd Exhibitors, 1st, H. Corning, 2nd and 3rd, Roper Bros.

Herd Breeders young, 1st and 3rd, Roper Bros., 2nd, H. Corning.

Bull and 3 of his jeb, 1st, Roper Bros.

Bull and 3 of his get, 1st, Roper Bros.

SHEEP.

COLSWOLDS—Ram 2 shears and over, 1st and 2nd, Howard Corning, Cheggogin, N. S., 3rd, Jno. A. McNaughton; Shearling, 1st and 2nd, Jas. A. Telfer, Markhamville, N. B., 3rd, Howard Corning; Ram, Lamb, 1st, Jas. Telfer, 2nd and 3rd, H. Corning; Ewe, 2 shears and over, 1st and 2nd, Jas. Telfer, 3rd, H. Corning; Shearling Ewe, 1st and 2nd, Jas. Telfer, 3rd, H. Corning; Ewe, Lamb, 1st and 2nd, Jas. Telfer, 3rd, H. Corning; Pen, 1st, Jas. Telfar, 2nd, H. Corning; Pen Lambs, 1st, Jas. Telfer, 2nd, H. Corning.

LEICESTERS

RAM—2 shears and over, 1st, Jas. Telfer, 2nd, Albert Boswall, Pownal, P. E. I., 3rd, Retson Bros., Truro; Shearling, 1st, S. L. Boswall, 2nd, Jas. Telfer, 3rd, Retson Bros.; Lamb 1st, Telfer Bros., 2nd, A. Boswall, 3rd, S. L. Boswall.

EWE—2 shears, 1st and 2nd, Albert Boswall, 3rd, S. L. Boswell; Shearling, 1st and 3rd, Retson Bros., 2nd, Albert Boswell; Lamb, 1st, Albert Boswell, 2nd and 3rd, Jas. Telfer;

PEN—1st, A. Boswall, 2nd, Retson Bros.; Lambs, 1st, Jas. Telfer, 2nd, A. Boswall.

LINCOLNS.

RAM—2 shears, 1st, Jas. Telfer, 2nd, A. Boswall, jr.; Shearling,1st, Jas. Telfer, 2nd, A. Boswall, jr.; 3rd, Jno. McNaughton; Lamb, 1st, A. Boswall, 2nd, Jas. Telfer.

EWE—2 shears, 1st, A. Boswall,

THE MARITIME FARMER

And Co-Operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association; The Nova Scotia and P. E. Island Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The Newfoundland Agricultural Board, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for discontinuance is given.

The date after your name on the little green label on front page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

1 inch—First insertion 75 cents; 2 inches—First insertion $1.50; 3 inches—First insertion $2.25.

Contract rates on application.

Address all letters and make all checks, money orders, postal notes, etc., payable to

NOTICE TO ADVERTISERS—Changes for ads. should reach this office one week before date of issue, in order to insure insertion.

SEPTEMBER 26, 1911.

DATES OF ISSUE.

October ..... 11—31
November ..... 14—28

"FRESH" EGGS.

In a certain play, the name of which we have forgotten, there is an incident in which a lady approached the quaint and antique old-world store and asks the dealer for some eggs, at the same time enquiring whether they are fresh, "Yes," responded the conscientious dealer,—— "that is to say they were fresh!" Which, according to human experience, all too often describes the quality of eggs that change owners in the ordinary course of business. The dealer buys eggs that were fresh, but are supposed to be fresh, and sells them as such. So it has come to be said that an egg is a lottery.

Now what can be done to assure absolute freshness of quality in every egg that is offered for sale, or at least that consumers may have reasonable confidence that the eggs they buy are good? We have no plan to suggest. Nor do we know of anyone who seriously puts forth any scheme as being absolutely sure to place every egg in the hands of the consumer in perfectly good condition. The experience of other countries in the marketing eggs may, however, be of some assistance in guiding us to the securing of better results.

In this connection we were interested the other day in reading the report of Canada's Commercial Agent in Australia. Mr. Ross tells, among other things, in a recent report to the Department of Trade and Commerce, of the methods followed there. It is quite a common practice he says, for suppliers in many parts of Australia to place a distinctive individual mark, and the date on which the egg was laid, upon each egg, by means of a rubber stamp. Grocery stores doing a high class trade will readily give up to 3d. (6 cents) per dozen higher than the ordinary market rates for reliable eggs so dated and marked in such a manner that the supplier can be traced. The co-operative distributing companies in Melbourne handle large quantities of eggs, which are collected at the butter factories in the country, and they report more or less difficulty in regard to the quality of the eggs received. Being the largest wholesale distributors, the co-operative companies make every effort to supply thoroughly sound and reliable eggs. When a flagrant shipment comes to hand the government poultry expert makes an examination of the eggs and a certificate is given by him under which the wholesalers can deduct the number of bad eggs from their account sales. Supplies received from each factory and produced in the country are carefully noted and if there is a repetition of bad shipments the factory and producer in the country are advised accordingly. In some instances the distributors refuse to handle certain producers' eggs, and in this way the quality is to a great extent upheld. In the summer, when eggs are plentiful, large quantities are preserved through the use of a liquid known as "Water Glass" which is stated to have silicate of soda as its chief ingredient.

THE MARITIME FARMER HAS CHOSEN ST. JOHN FOR ITS NEW HOME.

Our readers will notice that this issue of the MARITIME FARMER is dated from St. John, N. B., instead of from Sussex, N. B., as has been customary ever since we made our bow to the public about sixteen years ago. During the years that the MARITIME FARMER has been in existence it has forged ahead by leaps and bounds. The printing has heretofore been done by contract at the offices of the Maritime Publishing Co., Sussex N. B. The amount of labor entailed in printing the FARMER is an altogether different proposition to-day to what it was at the time of its first inception so that during the past year or two our printers have been taxed beyond their capacity.

The Directors of the R. D. Robinson Publishers' Limited, therefore, decided to purchase and operate their own plant and on looking into the situation, very carefully, they finally decided to locate their offices and plant at the corner of Clarence and St. David Streets, St. John, N. B. One of the reasons for locating in St. John is due to the fact that a great many of the firms who advertise in our columns have branch offices in St. John and from henceforth we will be able to keep in close touch with our advertisers and still be in as close touch with our readers. We realize that anthentic market reports are a valuable feature of any paper. We have frequently been unable to get what we considered reliable information along this line and true to our policy of protection to our readers we have often thought it best to not publish market reports at all, unless we were assured that the figures were reliable so that there would be no chance for our readers to get misled. We hope in the city of St. John to be in closer touch with all market centers than we were at Sussex and will try to give our readers accurate information on marketing conditions to guide them in the buying and selling of farm produce.

Visitors to our offices in Sussex have always found the latch strung on the outside. We assure our readers that we will be just as glad to see them at our new home, corner of Clarence and St. David Streets, St. John, N. B. as we have in the past. We cordially invite our readers to visit our offices whenever they chance to be in the city.

Address all correspondence in future to the MARITIME FARMER, Corner Clarence and St. David Streets, St. John, N. B.

N. S. C. A. STUDENTS MAKE GOOD.

Now that the fall season is approaching, we would call the attention of our readers to the Nova Scotia Agricultural College. The next regular session at this institute commences on November 1st. Since the opening of the college six years ago, the attendance has been gradually increasing and steady progress has been made. The best feature of the college work is that the students are making good. The great majority are now engaged in farming in the Maritime Provinces and the management of the college can point with pride to their attainments.

While the majority of the college graduates are now engaged in practical farming, between 5 p. c. and 10 p. c. have taken post graduate courses at Guelph or Macdonald college and elsewhere and their record is a most enviable one. These students enter the third year course on a par with the regular students at these institutions, and despite the seeming handicap of taking work under new instructions, they have almost invariably stood at the top of their classes. The result has been that, on graduation, their services have been eagerly sought. We present herewith, a partial list of the positions held by the se students who commence their course at the Nova Scotia Agricultural college and complete it at one of the institutions mentioned above. These men are now commanding salaries varying from $1000 to $2000 per year. following is the list:

E. S. Archibald, Professor of Agriculture and Farm Superintendent, Truro, Nova Scotio.

E. Lewis, Superintendent of Fairs and Farmers' Institutes, Alberta.

P. H. Moore, Superintendent Dominion Experimental Farm, Agassiz, B. C.

G. H. Unwin, Member Staff of Agricultural College, Guelph Ontario.

F. E. Ellis, Associate Editor, "Farm & Dairy," Peterboro, Ontario.

E. M. Straight, Assistant Professor, Professor of Horticulture, Macdonald College, Quebec.

B. H. Landels, Member Staff of Nova Scotia Agricultural College, Truro, Nova Scotia.

W. V. Loegley, Member Staff of Agricultural College, Minnesota.

N. C. MacKay, Member Staff Washington Agricultural College.

W. H. Porter, District Representative Ontario Department of Agriculture.

J. G. Taggart, District Representative, Ontario Department of Agriculture.

While the above list of names give some idea of the prominent positions which graduates from the Nova Scotia Agricultural College are commanding, yet the staff take infinately more pride in the statements of the majority of the ex-students at the college who are now engaged in farming at home and who are making better farmers and better citizens because of their work at the Nova Scotia Agricultural College

Feeding Rape.

Rape is now quite extensively grown by stockmen, and is recognized as being a profitable crop to grow to tide the cattle over the period of short pastures of late summer and early fall. It can be used either as a soiling crop or a crop for pasture. It usually requires from two to three months for the crop to become large enough for use, and the largest yield of forage generally results from sowing it in drills.

Rape usually has its highest feeding value about the time the tips of the leaves begin to turn purple; but if it is required sooner than this, it may be turned over earlier. It is better to let it become fairly well matured before turning sheep or cattle upon it, but for hogs it is more relished at an earlier stage. On good soil the leaves do not begin to turn purple in a good year until the plants are often nearly two feet in height. This is rather too coarse a growth for the pigs, which will be found to make better use of it as a pasture when it is about half this height or less. When sown in drills and kept cultivated, it makes an excellent crop to feed as a soilage crop, many growers preferring to feed this way, rather than pasturing it off, which is the usual method where it is broadcasted and does not get the great growth which is common in the former method.

All classes of stock, with the exception of the horse thrive well on rape. Cattle which, during the fall months, have the run of a rape field, or are fed rape, together with pasture, will go into winter quarters in much better condition than cattle which get no feed but grass. In fact they can be put in quite high condition in this way. Swine having the run of a rape field, along with clover or blue-grass pasture and grain, find in the rape both succulence and nutriment, and will make good gains, but rape alone is not a feed which will cause the pigs to make large gains. It is a feed which requires some supplementary feeding, in order to get the highest possible gains. While cattle and pigs thrive well on rape, it is specially valuable for sheep. Prof. Shaw says that an average crop will sustain 10 to 15 sheep per acre for 60 days, and rapid gains in both growing and fattening animals will be produced. Access to pasture is always advisable when feeding rape. If grain is fed with the rape, it will be found that the rape will about support the animal, leaving the grain to go wholly for the production of energy or gain. It is of great value in fitting sheep for the shows. It is generally fed in the pens for this purpose. Where hogs are to be pastured on it, it is asually advisable to use hurdles and give them a comparatively small piece at a time, so that they do not waste so much by tramping. In this way the pasturing can be commenced when the rape is quite small, and the growth of the crop outside of the hurdles is not interferred with. Cattle are generally allowed to pasture on the rape, although some practice feeding it as a soiling crop to this class of stock.

Some caution is necessary in starting cattle or sheep to pasture down rape. There is some danger of digestive troubles if the stock be turned on the rape before it is sufficiently matured, but the greatest danger is from bloat. The bloating is most likely to occur during the first few days of their feeding on it. It is never wise to turn hungry stock on rape lor the first time. Always allow the cattle or sheep, as the case may be, to have their appetites fairly well satisfied in pasture or other feed, and then turn them into the rape. They will not be over hungry, and consequently are not so likely to gorge themselves. The risk of trouble from bloating can be almost entirely avoided by turning the stock on the rape when it is dry, after the dew is off, and leaving them on for a short time the first day, longer the second, and so on, until they become accustomed to it, when they can run on it at will, with little danger. Do not forget that stock should never be pastured exclusively on rape. They shou,d have free access to a grass field and the rape field at the same time. Pigs turned in wet rape sometimes suffer from skin trouble, brought on by the irritation caused.

What is Good Seed Grain ?

The threshing season is now on and the farmer who would reap a bountiful harvest in 1912, must now begin to take care of the seed for next year's crop. The following article contains some valuable ideas on this important question:

The successful live stack breeder does not select the runty pigs, says C. W. Warburton, an American, the poor scrubby calves or the undersixed, poorly developed individual of any class of live stock to use as his breeding stock. He consigns these animals to the fattening pens and sends them to market as soon as he can, and uses only the very best animals he can raise or purchase in his breeding herd. His experience and the experience of other breeders have taught him that this is the proper method to follow in order to keep up the standard of his herd or his flock, and to improve it. It is just as important for the farmer who grows small grain, or in fact any other crop, to use the strongest and best seed in order to secure a profitable harvest and to prevent it from deteriorating in yield and quality.

It is true that the soil and its preparation, the climate, and numerous other factors as well as the quality of the seed influences the quantity and quality of his crop. It is probable that these factors, some of which he cannot control, have a greater influence than the outside factors with which the animal breeder has to contend, yet that fact only increases the importance of good seed to the crop grower, and emphasizes the desirability of using all possible means within his control to further the production of good crops.

The average production of wheat for the past ten years in the United States has been 14.4 bushels to the acre, of oats, 29.7 bushels; and of barley, 25.9 bushels. For the same period the acre production of wheat in Minnesota has been 13.6 bushels to the acre; of oats, 32.1 bushels; and of barley, 25.5 bashels. There are few who will deny that it is possible to very materially increase this production, and the beginning of this increase should come through the seed. It is not our intention to minimize the importance of proper selection of varieties and of soils, the proper preparation of the soil, the after treatment of the crop so as to produce the best results, or any other means which are available, but the work can be begun now in the selection, grading and cleaning the seed, while the work of preparing the soil and handling the crop must necessarily be done at a later date. It is important, then, that good seed should be prepared now for spring planting, so that as soon as conditions are right, it can be put into the ground without delay.

THE ESSENTIALS OF GOOD SEED.

There are several factors which go to make up good seed grain. It should be plump, heavy, and well filled with plant food; it should be viable; it should be of a good variety, one which is well adapted to the section in which it is to be sown and for the purposes for which the crop is to be used, true to name and free from mixtures with other grains; it should be free from weed seeds of all kinds; and it should be free from diseases.

THE ADVANTAGES OF PLUMP SEED.

Plump, heavy seed is better than weak, small shriveled seed for the same reason that a large egg will produce a stronger chicken than a small one; it contains more food to produce growth. The young plant depends on the seed for its plant food during germination and the early stages of its growth, until it has developed a root system large enough and strong enough to take its food from the soil, so it is very reasonable that a large, plump seed with plenty of plant food stored away for nourishment of seedling will germinate more quickly and produce a stronger plant than a small, weak seed with a small supply of plant food. Plump seed will not only produce a better and more uniform stand than small or mixed seed, but the plants produced from it will grow more uniformly, will be stronger and more vigorous throughout the season, and will yield more grain, than those from weak seed.

The greatest benefit from the selection of large, plump seed will come after years of repeated selection in this way, though it is likely that some increase in yield and quality will be shown the first year. An experiment which was conducted in Ontario for twelve years in which seed oats were separated into light and heavy grades, and the selection was continuous—that is, the light seed for sowing each year was taken from that produced by the light seed of the previous year, and the heavy seed from the heavy—showed a marked increase in favor of the heavy seed, and one which was greater in the later portion of the experiment than in the earlier. The heavy seed averaged 22.5 bushels to the acre more than the light seed in the last four years of the experiment, and weighed 9.5 pounds to the bushel more. Similar results have been obtained with wheat and barley. In an experiment conducted for seven years at the Ohio station with light, orinnary and heavy seed oats, the average yields were 42.6, 44.8, and 46.3 bushels respectively for the various grades.

HOW TO GET HEAVY SEED.

Any good fanning mill or grain grader will take out the good seed if it is used properly. To obtain the best results from the use of large, heavy seed, however, it is necessary to take out a much larger portion of the light and ordinary seed than is usually done in grading grain for sowing. Not more than one-half of the grain which is cleaned should go into the portion for sowing, it is better if only one-third is used. The remainder can be used for feeding to stock, but if the screenings contain any considerable number of weed seeds, they should be ground. If a fanning mill is not already on the farm, it will pay to purchase one, unless it is possible to make arrangements with your local miller or elevator man to clean your grain for you.

It is even possible to remove some of the light, weak grains and a considerable portion of the weed seed by dumping the grain to be cleaned into a barrel or tub of water and stirring it thoroughly, then skimming off all that rises to the surface. This method is better for barley than for the other grains, as the weight of a kernel of barley is only a little greater than that of the water it displaces, so all the good grain sinks to the bottom and the light grain rises to the top. Wheat is too heavy to be cleaned in this way, and oats are usually too light. The method cannot be recommended when it is possible to grade the grain in any other way.

VIABILITY.

Viable seed is that which is live, or in other words, has the power of germinating and producing a strong plant. It is just as important to test the germinating power of your wheat, oats, barley, and other small grains as it is to test the germinati ion of your seed corn. Seed which does not show a high percentage of strong germination should not be used for sowing, or if it is not possible to get viable seed, the rate of seeding should be increased sufficiently to make up for the low germination. A good germinator can be made very easily at home by placing two pieces of blotting paper on an ordinary plate, moistening them and putting 100 seeds between them. The seed should be selected from different portions of the bin, or better still, several tests should be made and the average taken. The germinator should be kept moist, and in a moderately warm place. The seed should show strong sprouts in four or five days.

A GOOD VARIETY DESIRABLE.

Good seed, in addition to being large and plump and of strong germination, should be of a definite variety, pure and true to name, and free from mixtures with other grains. It should be of a variety which is adapted to the section in which it is to be grown, and one which is suited to the use which is to be made of the crop.

Do not make the mistake of sending to some distant place for seed, no matter how attractive it may look, for it is very likely to disappoint you. It is probable that the variety which succeeds somewhere else will not be as good in your locality as that which you are already growing or which you can get in your neighborhood, particularly if the local seed is thoroughly cleaned and graded. The results obtained at the experiment stations fully justify this assertion.

The seed you sow should not only be of a good variety, but it should be free from mixtures with other varieties or with other grains. This is not so important if the grain is to be fed on the farm where it is grown, but it is very important if it is to go to market. The miller, the malter, and the crusher object very seriously to other grains in the wheat, barley and flax they buy, and the country elevator usually charges up a dockage against grain which contains any mixture of other grains. It is more essential that the wheat you grow is of a single variety than it is with the other grains, for wheat which contains a mixture of two or more varieties with different milling qualities makes a world of trouble for the miller. If there is any blending to be done, he prefers to do it himself.

FREEDOM FROM WEED SEEDS.

Good seed grain should be free from weed seeds. There is no more common method by which weeds are spread than through our seed grain. It stands to reason that two plants cannot occupy the same space at the same time, so when we sow weed seeds with our grain we introduce plants which will later crowd out the grain plants and just so far reduce the yield. Weeds take plant food and moisture from the soil, and so reduce the supply available for the crop. If the weed seeds make up but two per cent of the grain which is sown, and reduce the production of the crop by just that much, we lose from a third to a half bushel of wheat and from a half bushel to a bushel or more of barley and oats on every acre. The percentage of weed seeds is often greater than this, however, and as weeds usually grow more vigorously than the grains and occupy more space, the percentage of loss is much greater than the percentage of weed seeds.

EXPLANATION OF TERMS—FRUIT

Arrangement.—Taste and skill in staging so as to attract attention and add to the general appearance of the exhibit.

Colour.—Bright clear, well developed colour, characteristic of the variety.

Commercial Value.—Standard, known market varieties, as grown in and suited to the district, preferred.

Form.—In all cases, except seedlings, refers to the normal type or shape of the variety, but in the case ol seedlings it refers to shape as desired in a commercial variety. A roundish apple is of the most desirable shape, and oblate and oblong apples least desirable.

Freedom from Blemish.—Any injury by insects, fungus, bruises, loss of stem or other cause, lessening the value or appearance of the exhibit shall be called a blemish.

Nomenclature.—Exhibits must be correctly named according to the nomenclature adopted by the Society, Association or Exhibition at which they are shown. The use of the standard of nomenclature adopted by the American Pomological Society is recommended to such bodies.

Polishing—Fruit on exhibition shall have as much of the natural bloom as possible. Judges should discourage polishing.

Quality and Texture.—To be considered in collections, seedlings, new varieties on trial, or other sorts in competition.

Season.—In collections it is desirable to have as long a season as possible represented by the varieties shown. Varieties past condition shown for the purpose of lengthening the season will not, however, score as high as apples in condition though of later season.

Size.—While size in some cases indicates care and skill in production, it is not usually found with the highest colour and with freedom from blemishes; and as large size is not as important as high colour and freedom from blemishes, the largest fruit should not take the first prize unless it is equal or better in other respects than those in competition with it.

Uniformity.—Specimens should be as nearly alike in size, form and colour as possible.

EXPLANATION OF TERMS—PACKING AND PACKAGES.

Alignment.—Alignment refers to the rows of fruit in the box—the straighter and more regular the rows the better is the alignment.

Attractiveness and Style of Pack.—When the box is opened the fruit should look attractive. The skill and good taste of the packer is shown in the appearance of the fruit and the style of the pack. There are many styles of pack, but the one should be used which lends itself best to the variety and size of fruit packed. The diagonal pack with solid tides is preferred. The fruit should be as nearly alike in size and colour as possible. The box also should be clean and attractive looking.

Bulge.—A bulge or swell in the top row of fruit is necessary in order to ensure the fruit carrying well. Before the top is put on there should be a bulge of one and one-half inches in the centre of the top row and the fruit should be one-quarter of an inch above the top of the box at the ends. When the cover is on there should be a bulge of three-quarters of an inch at the centre, at both top and bottom.

Facing.—When facing a barrel, or when beginning to pack a barrel, the apples for the first row should be put carefully in with the stem end down, the stems having been first cut off so that they will not injure the fruit when pressed. If slightly smaller apples are used in the outside rows and larger ones in the centres it improves the appearance of the face. A second row is put in, in the same manner as the first, and these apples should be arranged so they will show through the spaces between those in the first row. These two rows constitute the face of the barrel. The fruit used for the face should fairly represent the fruit throughout the barrel, but the apples in these two rows should present as an attractive an appearance as possible. The law in regard to facing, as defined in the Inspection and Sales Act, is as follows: "No person shall sell or offer, expose, or have in his possession for sale any fruit packed in which the faced or shown surface gives a false representation of the contents of such package, and it shall be considered a false representation when more than fifteen per centum of such fruit is substantially smaller in size than, or inferior in grade to, or different in variety from the faced or shown surface of such package." Apples in barrels for exhibition should be packed as required by law.

Finishing.—By finishing is meant the heading, lining, cleating and marking the box or barrel. The heads of the barrel should fit snugly into the chine. For barrels, six rosined nails in each head are usually sufficient. They should be skilfully driven through them and through the top or bottom into the ends of the box. The sides of the boxes should with four nails at each end of each side of the box. The nails used should not be smaller than those known as five-penny.

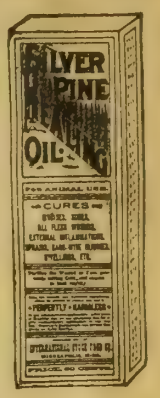
Marking.—The marking of barrels and boxes should be distinct and attractive. It should comply with the regulations of the Inspection and Sales Act, which call for the initials of the Christian names of the packer, his surname, and his address; the name of the variety of fruit, and the designation of the grade, whether it be "Fancy," "No 1," "No 2," or No. 3." Such mark may be accompanied by any other designation of grade or brand if that designation or brand is not inconsistent with, or marked more conspicuously than, the one of the said four marks which is used on the said package."

Material for Barrels.—The standard barrel must be large enough to contain at least 96 quarts of fruit. Smaller barrels should not be exhibited. The barrel in general use in Ontario has staves 30 inches in length. In Nova Scotia, the staves are 28 inches long. The dimensions called for in a standard barrel of minimum size are: Between heads, 26½ inches wide, inside measurement; head diameter, 17 inches, inside measurement; middle diameter, 18½ inches inside measurement. The barrel generally used in Ontario is 27½ inches between the heads, 17 inches in diameter at the head, and with a middle diameter at the bilge of 19½ inches. A good barrel should have sixteen staves with 9-16 jointing, cut five to two inches and averaging four inches in width at the bilge, and be free from large knots or shakes. The head should not be less than one-half an inch in thickness, dressed clean and sound. The hoops should be about 1⅜ inches in width and eight in number. The barrel should be new and clean.

Material for Boxes.—The box should be made of material strong enough to withstand handling in transportation. The heads or end pieces should be each of one piece of wood and not less than three-quarters of an inch thick. The sides also should be each of one piece and not less than three-eighths of an inch thick. The top and bottom boards may be of one or two pieces, preferably two, but not more than one-quarter of an inch in thickness. They must be thin, so that they will bend readily when the box is closed. There should be two cleats each for the top and bottom. Dovetailed boxes are not desirable. The standard box must be used. This is 10 inches deep, 11 inches wide, and 20 inches long, inside measurement.

Pressing.—Apples are often overpressed. If the barrel is racked well there need not be much pressing. The proportion of fruit that is injured by pressing will be evident when the barrel is opened. The less fruit that has been injured by pressing the better the barrel has been packed, provided, always, that the pressing

Silver Pine Healing Oil Healed a Barb-Wire Cut without leaving a scratch



Mrs. Kate McCrane, of Mowbray, Man., writes:

"Please send me a bottle of your Silver Pine Healing Oil. I had a colt cut last winter with barb wire—I used half a bottle and it healed up and didn't leave a scratch. Now I have another colt that has got cut that I calculate to heal with what is left, but I would like to have you send me another bottle if I should happen to need it, for I think I could not get on without it."

For all kinds of wounds, bruises, burns and sores on animals or human beings, Silver Pine Healing Oil is a quick, safe and wonderful healer. Keep a bottle on hand for times of need. In 25c., 50c. and $1.00 bottles, at your dealer's or from the

International Stock Food Co., Limited, Toronto, Can.

SEALED TENDERS addressed to the undersigned and endorsed tender for Wharf at Little Lameque, N. B., will be received at this office until 4 p. m., on Monday, October 2, 1911, for the construction of a Wharf at Little Lameque, Gloucester County, N. B.

Plans, specification and forms of contract can be seen and forms of tender obtained at this Department and at the offices of Geoffrey Stead, Esq., District Engineer, Chatham, N. B., E.T.P. Shewen, Esq., District Engineer, St. John, N. B., and on application to the postmaster at Lameque, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation, apd place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works equal to ten per cent. (10 p. c.) of the amount of the tender, which will be forfeited if the persons tendering decline to enter into contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 7, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department

METALLIC CEILINGS

are everything that plaster, wood and wall paper are not.

Metallic Ceilings are fireproof, absolutely.

Metallic Ceilings don't crack or crumble—don't get damp or mouldy—don't need repairs.

Metallic Ceilings are far-and-away the most economical building material you can put in a house.

You don't believe it? We can prove it. Write us for the facts.

The Metallic Roofing Co. Limited

MANUFACTURERS

TORONTO AND WINNIPEG

(50)

TENDERS FOR DREDGING

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Dredging Buctouche Harbour, N. B.," will be received until 4 p. m. on Tuesday, October 3, 1911, for dredging required at Buctouche Harbour, N. B.

Tenders will not be considered unless made on the forms supplied, and signed with the actual signatures of tenderers.

Combined specification and form of tender can be obtained on application to the Secretary, Department of Public Works, Ottawa. Tenders must include the towing of the plant to and from the work. Only dredges can be employed which are registered in Canada at the time of the filing ofthe tenders. Contractors must be ready to begin work within thirty days after the date they have been notified of the acceptance of their tender.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for five per cent of the contract price which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order
R. C. DESROCHERS,
Secretary,

Department of Public Works,
Ottawa, September 16, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Pier at Upper Salmon River, N. B." will be received at this office until four p. m., on Wednesday, October 4, 1911, for the construction of a Pier at Upper Salmon River. Albert County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained on application at the offices of E T. P. Shewen, Esq., District Engineer of St. John, N. B., Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster at Alma, Albert County, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signatures the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, eqeal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheqne will be returned.

This Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 6, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

given has been sufficient to secure the required firmness. Barrels loosely packed frequently show more injury to the fruit through shaking than barrels over-pressed.

Racking.—All barrels of apples should be racked when being packed, so that the fruit will settle, and the packer thus be able to tail his barrel so that the fruit will carry well. When the barrel is opened the fullness or slackness will indicate how well the fruit has been racked. Over-pressed fruit is usually found when apples have not been racked well.

Solidity.—This may also be expressed by the terms firmness and compactness. The more solid the pack the better the fruit will carry.

Tailing.—By tailing is meant the putting and placing of the last fruit into the barrel. All that is necessary in good tailing is to have the surface as level as possible with the stem end down when the apples are pressed. The care in tailing will be known when the barrel is open by the manner in which the fruit has been bruised when pressing.

W. T. MACOUN,
Chairman of Committee.

Black Heart in Apple Trees.

Fruit growers have long known of a trouble called "Black Heart" which is very common in some kinds of nursery stock. The varieties affected are altogether those that are easily injured by freezing; for instance, the disease is very common in Baldwin and Rhode Island Greening, and it is said by fruit growers and expert nurserymen to occur in the nursery row. A great deal of discussion has taken place over the advisability of planting black hearted trees, and the general opinion is that they are not suitable for planting out because of the fact that the decay of the injured wood very materially shortens the life of the tree.

I have not been able to obtain very much information on the cause of Black Heart, but from opinions I have heard expressed by expert fruit growers, and from what I have seen myself, there seems to be little doubt that the prime cause is some form of winter injury. I have noticed in fruit trees around Guelph that the Black Heart begins in every case with the wood formed in the summer of 1903. The winter of 1903-4 was unusually severe all over Ontario and elsewhere and killed outright a very large number of trees. Trees which were more or less severely injured at that time, but not killed, have been dying ever since.

Certain varieties are much more easily injured than others. Certain kinds of soil, particularly those inclined to be wet or of such a nature as to keep trees growing late in the season, favor the trouble. In certain cases, the injury seems to depend partially on the slope of the land and the nature of the soil. The Baldwin is perfectly sound on southern slopes and on northern slopes has been almost entirely killed out. In the vicinity of Cobourg, Baldwin and Greening have killed out seriously on clay soils, and are almost entirely uninjured on sand or light soil.

J. W. Iron, O. A. C.

Influence of Moisture on Apple Trees.

The Journal of Agriculture reports that during the past two years experiments have been carried on at Macdonald Agricultural College to determine the effect of soil moisture on the development and functions of apple-trees. These experiments indicate that an excess of moisture in trees causes a lower percentage of blossoms to set. An increase of one percent in the moisture reduced the fruit by 10 percent. On the other hand the quality of fruit tends to improve in proportion to the amount of moisture

Two Minute Talks About

PANDORA RANGE

for Coal or Wood

YOU can quickly get the Pandora oven ready for the baking. It is made of *Nickel Steel* which is much more sensitive than a cast or gray iron oven. It heats up more rapidly and thereby saves you many precious minutes.

After you've used the *Nickel Steel Oven* for a week you'll congratulate yourself that you invested in a Pandora Range. Get one this week. Make up your mind you'll enjoy its many conveniences at once. Our agents in your locality will fill your order promptly.

McClary's

Stands for Guaranteed Quality

75

London, Toronto, Montreal, Winnipeg
Vancouver St. John, N.B., Hamilton, Calgary

But this is believed to be due to the fact that with a thiner set, no matter what the cause of the thining, quality tends to improve.

In regard to winter killing, the facts brought out being based on experiments with three-year-old Ben Davis nursery stock, it is stated that the amount of winter killing is largely dependent on the condition of roots of trees and the soil in which they are placed during the winter months. A very heavy mulch will prevent the roots of trees being frozen, and consequently there will be a heavy early flow of sap in the spring and this tends to damage in case of light spring frost. On the other hand, if there is no mulch at all in the fall, there is equal danger of winter killing due to an excessive drying up of the wood in cold weather. The best method of guarding against an undue drying up on the one hand, or a too heavy flow of sap on the other will be found in sowing a cover crop in midsummer. This will not only provide a reasonable mulch for all, but will also check late growth in autumn and so tend to harden the wood of trees against winter.

Carrying Vegetables to Market.

I live 22 miles from San Antonio, my market town, and haul vegetables there during the fall, winter and spring. I get them to market in good shape by the following method: Early in the morning I commence to pull and bunch the vegetables, such as beets, radishes, collards, Dwarf Essex rape (the peddlers call it kale) bunch onions from sets, shallots, mustard and turnips.

I wash the stuff by immersing in plenty of water, letting it stay in 10 or 15 minutes. Then I bunch it, after shaking it lightly, so as to leave it good and wet. I spread the bunches in rows, not more than two deep, on the floor in a cool, shady room, with plenty of ventilation. If the weather is warm, I sprinkle the stuff early the next morning before loading, but sometimes load the same night, sprinkle and leave exposed to the night air.

Before starting for market I wet two sacks and cover the load, then spread the wagon sheet double over all, and when I get to town the vegetables are as fresh as when first pulled.—Walpole Nockolds, Atascosa Co., Tex.

Few, if any, medicines, have met with the uniform success that has attended the use of Chamberlain's Colic, Cholera and Diarrhoea Remedy. The remarkable cures of colic and diarrhoea which it has effected in almost every neighborhood has given it a wide reputation. For sale by All Dealers.

If you knew of the real value of Chamberlain's Liniment for lame back, soreness of the muscles, sprains and rheumatic pains, you would never wish to be without it. For sale by All Dealers.

DAIRYING.

Publicity and Payment as Factors in Effecting Improvement.

Bulletin No. 337 issued by the New York Agricultural Experiment Staton, contains some suggestions that should be of much value to those who are seeking to improve the milk supplied to towns, and to those interested in the betterment of cream supplied to creameries.

This bulletin is really an account of the way in which improvement in its milk supply was brought about by the city of Geneva, in the state of New York.

Geneva is a city of 13,000 people, supplied by 550 cows distributed among 40 dairies. The bulletin says: "There is every reason to believe that in 1907, at the beginning of the studies here reported, the general quality of the milk supply was representative of that of smaller cities. It is not the poor quality of the supply, but rather the progressiveness of Mayor A. P. Rose, which led to this attempt to study and improve its quality."

The method employed was to score each dairy quarterly upon the basis of the sanitary conditions under which the milk was being produced, to furnish this score to the producer and retailer, so that it could be made the basis of payment under their contracts, and to publish the score of all the producers, with the names of their retailers, so that the consuming public could purchase intelligently.

The history of the inspection and its results makes a most interesting story. In comparing the dairies, the sanitary conditions surrounding the production and handling of the milk were reduced to a numerical basis by means of a score card. In order to make these numerical results easily understood, they were grouped under the following heads: "Poor," including filthy conditions; "medium," where conditions were merely dirty; "good," where the conditions were fairly clean; "excellent," where they were both clean and sanitary.

The first inspection showed that 37.5 per cent of the dairies were "poor," 57.5 per cent "medium," and 5 per cent "good."

When the work of improvement was undertaken, a meeting of the milk producers and milk dealers was called, and it was explained to them that as the inspection proceeded the results would be given to the public in such a way that the consumers would know what quality of milk was being handled by each dealer, and also what each dairyman's milk was like in case he undertook to market it himself. The very rapid improvement effected may be judged from the following statements:

At the end of one year 2.9 per cent of the dairies ranked as "excellent," 58.9 per cent as "good," and 38.2 per cent as "medium." None were "poor," although almost two-fifths of the dairies had been in this class the year before.

At the end of the second year 8.6 per cent of the dairies ranked as "excellent," 82.8 per cent as "good," and 8.6 per cent as "medium."

At the end of the third year 12.8 per cent of the dairies ranked as "excellent," 74.4 per cent as "good," and 12.8 per cent as "medium."

At the end of the first quarter of the fourth year 12.8 per cent of the dairies eanked as "excellent," and 87.2 per cent as "good," the "medium" grade having finally disappeared.

A most interesting feature in connection with the case developed midway in the experiment. At this time the retailing of the milk fell practically all into the hands of two companies. One of these concerns paid for its milk on a sliding scale, giving a higher price for milk to each patron that reached the higher grades and a lower price to those that fell down to the lower scorings. The other company paid a uniform rate for milk of all grades.

The result was that soon the first named was in receipt of milk from nearly every dairyman who scored up well, and the other concern was receiving all the lowest scoring product. Then the next result was that the financial stimulus being neglected by the latter company, its patrons began to neglect even what precautions they had been taking, and their milk commenced to deteriorate and reach the lowest scorings. Then the public withdrew its custom from this concern to such an extent as to bring it to a crisis where, to save itself, it was forced to take adequate steps to ensure the quality of the product delivered to it.

The whole study most unerringly leads to the conclusion that publicity and payment based on quality are to be the real factors in improving a city milk supply. And we may reasonably ask if it is not right to recognize the same factors as the most likely to be effective in improving the quality of the cream to be supplied to our own creameries.

When Cream is Churned.

The churn should be thoroughly scalded and cooled with clean, cold water before the cream is put into it. The temperature of the cream when in the churn should range from 56 to 58 degrees, and it should be churned for 30 or 40 minutes. The butter will then be separated from the cream so that the buttermilk may be drawn off. If the cream is churned at a higher temperature too much fat will be lost in the buttermilk. In order to recover all the fat globules in the cream it becomes necessary to cool it to such a temperature that the large fat globules will not agglutinate until after the smaller ones, and churn it to a degree that htey will not pass through the strainer.

If the cream is too cold the butter has a tendency to become too firm, with too small an amount of water incorporated. Some water mixed with the fat gives the peculiar character to good butter and differentiates it from butter oil or butter grease. About 14 per cent of water is necessary. If butter is churned at a temperature of 52 to 54 degrees, it generally comes with a low per cent of water, and in order to recover the water it becomes necessary to wash the butter with water at a higher temperature, ranging from 60 to 62 degrees. The butter should be in a granular form. It is then an easy matter to remove all the buttermilk and develop a temperature that is quite uniform with the wash water, which also influences the recovery of the desired amount of water. The smaller the amount of salt the better for a most delicate product and the best keeping quality. Salt and free lactic acid when combined develop a stale flavor, which is often termed "fishy." Salt should first be put in a moist condition, and a period of at least thirty or forty minutes should be allowed for working the salt into the butter before it is ready to put in prints.

The only commercial and salable way of putting up butter is to put it up in pound or half-pound prints. For this it is necessary to have a small printer into which the butter is thoroughly pressed and set away for four or five hours to cool. It can then be printed and wrapped in parchment paper and placed in a carton which represents the brand. The package should be sealed in order to avoid tampering. The entire process would be unprofitable to the producer if sold at the regular market price. Butter of this character should command a price of not less than 35 cents a pound at the producer's plant. There is a chance to make a strictly up-to-date farm butter making plant profitable, because there are consumers who are willing to pay the price for good butter.

Cream Profits That Stay in Your Pocket

Empire Disc.

THERE was a time when the first cost of a separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest return for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Sussex, - - New Brunswick.

Farm Agents Wanted in Unrepresented Districts.

Guard Against Tainted Milk.

The dairy department of the Wisconsin College of Agriculture is now receiving milk and cream from over 200 farms. From 1,500 to 2,000 lbs. of butter, 100 pounds of cheese and a small amount of ice cream are made daily in addition 100 gallons of cream are pasteurized, bottled and marketed each day. Printed regulations are sent to all patrons supplying this product regarding the sanitary care of their milk, and each farm is occasionally inspected by a representative of the dairy department. It really requires little care and attention to maintain milk and cream in a clean, sweet condition even during hot, sultry weather. All that is necessary is to properly clean the cows, the milk cans, the stable and to efficiently cool and care for the milk.

The following regulations pertaining to sanitary management of the herd and care of the product are observed by patrons of the university creamery:

All milk cans should be washed first in cold water, then thoroughly cleansed with warm water and finally rinsed in scalding hot water. These cans should be washed as soon as received from the creamery and kept in a clean place protected from dust and bad odors. Exposure to direct sunlight is especially beneficial. Each cow's udder should be thoroughly cleansed before milking and the hands of the milker should be absolutely clean and dry.

The milk should be strained through one thickness of clean white flannel and then should be quickly cooled and well aired. Pouring or dipping the milk several times from one can to another rapidly accomplishes this purpose. Warm milk should never be poured into cold milk nor should the night's milk be mixed with the morning's milk. Milk should never be exposed to foul air in the cow stable or in dirty tanks before it is delivered to the creamery.

Tainted, musty or mouldy feed should never be served in the dairy herd rations. An accessible supply of pure, cold water should always be available for the herd.

Bloody milk or that from a sick cow should never be mixed with whole-some milk. The milk from a new milch cow should not be brought to the creamery until at least a full week after the cow has calved.

The uncovered cans of milk should be kept in cold water until they are delivered to the creamery. The stable should not be cleaned or brushed nor should silage or roughage be fed until all the cows of the herd are milked.

Pointed Lessons in Dairying.

The butter fat and feed records of the Pioneer and Besson co-operative cow testing associations of Iowa reveal facts of pertinent interest to every man who keeps cows. The test occupying a year, had 688 cows in the two associations last year. Two herds were made up entirely of pure-bred dairy cattle. The remaining 44 herds were owned by men who followed diversified farming, dairying with them being one branch of their operations. The records, then, represent the average farm conditions. The main points brought out by the records will be given briefly'

The best cow of the 688 showed a net profit of $106.77, the poorest a

DEPARTMENT OF RAILWAY AN CANALS.

Intercolonial Railway.

BADDECK BRANCH LINE.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Alba-Baddeck Branch," will be received at this office until sixteen o'clock on Thursday, October 12th 1911, for the construction of a branch line of railway from a point on the Intercolonial Railway near Alba to the town of Baddeck, a distance of 22.7 miles.

Plans, specifications and form of contract to be entered into may be seen and full information obtained on and after 15th inst 1911, at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Chief engineer of the Intercolonial Railway at Moncton, N. B.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labour, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $30,000.00, made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order,
L. K. JONES,
Secretary.

Department of Railways and Canals.
Ottawa, September 9th, 1911.

ABSORBINE

will reduce Inflamed, Swollen Joints, Bruises, Soft Bunches. Cure Boils, Poll Evil, Quitor, Fistula or any unhealthy sore quickly; pleasant to use; **does not blister** under bandage or remove the hair, and you can work the horse. $2 per bottle, delivered. Book 7 E free. ABSORBINE, JR., liniment for mankind. Reduces Painful, Swollen Veins, Goitre, Wens, Strains, Bruises, stops Pain and Inflammation. Price $1.00 per bottle at dealers or delivered. Will tell you more if you write. Manufactured only by

W. F. YOUNG, P.D.F., 124 Lymans Bldg., Montreal, Ca.

Running up and down stairs, sweeping and bending over making beds will not make a woman healthy or beautiful. She must get out of doors, walk a mile or two every day and take Chamberlain's Tablets to improve her digestion and regulate her bowels. For sale by All Dealers.

loss of $19.14. The actual difference in profit is, therefore, $125.91.

The average profit from the best cow in each of the 46 herds was $59.04. The average profit from the poorest cows in each herd was $16.03 or a difference of $42.41 apiece, in favor of the best cows.

In the Pioneer testing association 100 of the best cows produced an average of 289.2 pounds of butter fat, while the poorest produced 168.4.

The average cost of feed for the 100 best cows was $30.08. That of the 100 poorest was $30.59. Considering the butter fat production it will be seen that the best cows consumed but $7.89 worth of feed more per cow than the poorest, yet re turned $12.08 more butter fat each. The average net profit from the 100 best cows was$34.14 more than from the 100 poorest cows.

The man who keeps cows with a production of 289.2 pounds of butter fat a year can pay $19 per acre rent and make as much profit as the man who keeps cows averaging 168.4 pounds butter fat and pays $5 per acre rent. Next to getting rid of the poor cow, the greatest thing in Iowa dairying is better methods of feeding and caring for the dairy herd.—

N. E. Farmer.

Washing Butter Favorably Affects The Lactic Acid Bacteria.

In a series of experiments designed to show the effect of thorough wash. ing upon the keeping quality of butter, it was found in every case that the lactic acid bacteria developed much more rapidly and to greater numbers in the washed butter as compared to butter containing a large amount of buttermilk. The lactic acid germs are used by butter makers to ripen the cream before churning and are known as "starters." The object in using these bacteria is to produce that desirable flavor demanded by the public and to insure a uniform product from day to day. These germs produce lactic acid, the acid of sour milk, and in the elaboration of their own by-products prevent the growth of other undesirable germs.

In the unwashed butter, the casein offers food for a class of bacteria whose by-products are undesirable in the butter. The off-flavors characteristic of second grade butter are due to these germs. To what extent washing will remedy this evil is still to be determined by further experimentation. This much is known, the lactic acid germs are desirable and washed butter allows them to multiply and thrive in the butter, while the unwashed butter shows far fewer numbers of these germs throughout the experiments.

The experiment was carried out at both low and high temperatures. The same observations were made, with this difference, the whole process was accelerated at the room temperature, the greatest number of bacteria germs appearing in five to seven days. In the refrigerator the maximum numbers did not appear until fourteen days.

If all the butter made on the farms was washed better with pure water and worked sufficiently to remove the buttermilk, the quality of country butter would be greatly enhanced.

John F. Nicholson,

Bacteriologist, Idaho University Experiment Station.

WINDSOR DAIRY SALT

Every farmer's daughter and every farmer's wife knows

They all use it—for making delicious butter for their own table. They found out years ago that Windsor Butter Salt dissolves quicker, works in easier, and helps butter to keep better.

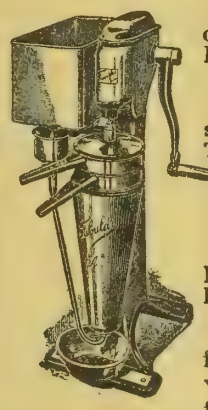
Windsor Salt is absolutely pure and every grain is a perfect crystal. 42

If you want to get "top" prices for your butter, use Windsor Butter Salt.

PAID HIM TO CHOOSE

SHARPLES

Tubular Cream Separator



Has anyone tried to convince you that disks or other contraptions are needed in modern cream separators? If so, read this:

Stouffville, Ont.

I separated 459 lbs. of milk through disk cream separator one week and produced 23 lbs. butter. The next week separated 459 lbs. of milk through the Tubular and produced 26¼ lbs. butter.

WM. HELMKY.

THE TUBULAR MADE 3¼ LBS. MORE BUTTER FROM ONLY 459 POUNDS OF MILK

It paid Mr. Helmky well to choose the Tubular, for Tubulars have twice the skimming force of others and repeatedly pay for themselves by saving what others lose. Dairy Tubulars contain no disks—wear a lifetime—are guaranteed forever by the oldest separator concern on this continent.

You will finally have a Tubular. Buy The World's Best first. Save yourself the expense of discarding some cheap or complicated separator. If you do not know our local representative, ask us his name. Write for catalog No. 194.

LIVE STOCK.

The Southdown.

The Southdown is the oldest of the improved medium-woolled dark-faced breeds of sheep. It bears much the same relation to the Down breeds as does the Leicester to the other long-woolled races. It is one of the indigenous races pecular to the chalk hills of the southern counties of England. It appears to have been confined to the Down lands and to have given way to a larger and looser framed animal, as the chain of chalk hills on which it browsed passed into the neighbouring county of Hampshire.

Originally the Southdown was horned, but these appendages have long since disappeared unless as slugs which occasionally appear on rams of the coarser type. The breed, before improvement, was small, long in neck, light in shoulder, bare of back, drooping in rump, but having a big leg of mutton. The fleece was not so close and firm as now, and inclined to curliness.

One of the earliest improvers of the breed was John Ellman, of Glynde in Sussex, who commenced his work about 1780, and died in 1832. This breeder laid great stress upon the form of the beck and fore-quarters, which he felt should be bold, high in crest, muscular and thick. These he aimed to develop as well as spring of rib,girth, breadth and fullness of quarter. The leg of mutton, according to Mr. Ellman, 'must be well filled inside and out, and as round as a 'cricket ball.' The fleece under his care became boardlike in its firmness, and showed cracks down to the skin as the animal turned, presenting a firm and springy surface. Following Mr. Ellman came the late Jonas Webb, of Babraham, Cambridgeshire, as an improver of the breed. It was through him in a great measure that the true type was handed down to the present generation.

Southdown Ram

The Southdown is one of the most beautiful sheep existing; its smooth, even body; its round, clean barrel; its short legs, fine head and broad saddle, with its sweet, tender seldom overfat meat, give the qualities which make it desirable to the lawn of the gentleman, while its early maturing and easy feeding qualities give it a place on the farms of men who must make profit from the products of the land. It is the smallest of the medium-woolled breeds, but owing to its compact form it weighs remarkably well for its size. A well developed ram in breeding condition should weigh about 200 pounds, and in show form from 225 pounds to 240 pounds. Mature ewes should weigh from 150 pounds to 200 pounds, according to condition. It is best adapted to undulating, rolling or broken and hilly land bearing a short fine herbage, but it adapts itself well to more level areas that are not wet. It matures early, its feeding qualities are unsurpassed and it stands crowding both in pen and field better than most breeds.

The fleece of the Southdown is the finest and shortest of the Down breeds. Unless at times of a shortage of coarser wools the wool of this breed brings a higher price than any of the others. It is dense and as a rule very uniform over the body. An average Southdown will clip from 5 to 7 pounds of unwashed wool.

For crossing purposes the Southdown has been particularly useful, and its blood exists in every improved Down breed. On account of its long established characteristics it stamps its good qualities upon its offspring in a remarkable degree.

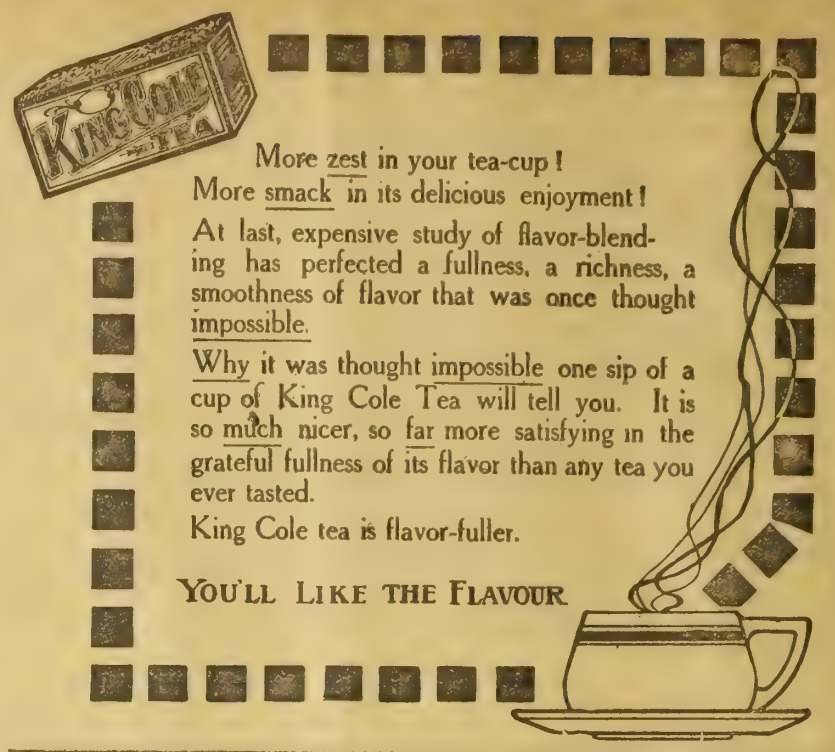
The face, ears and legs of the Southdown are of a uniform shade of grayish brown or mouse colour. The forehead and cheeks are well covered with wool of the same density and whiteness as found on other parts of the body. The ears are rather small, tolerably wide apart, covered with fine hair and carried with a lively back and forth movement.

The Southdown represents the ideal form of mutton sheep, inasmuch as it is admirably proportioned, of perfect symmetry, very compact and short in the leg. It is spirited and attractive, with a determined look and proud firm step.

Care of Purebred Breeding Animals.

The care of purebred breeding animals means more than simply throwing feed in abundance to them. Health is the first consideration, and a method of handling that would be entirely proper with fattening animals, that are to be kept only a few months, might possibly be entirely wrong treatment for breeding animals that are expected to live on and reproduce for years Economy of feed is not always the chief point to be considered in the handling of breeding animals, and it may sometimes pay (indeed, usually it will, I believe,) to keep our breeding animals under conditions where greater amounts of feed are required to maintain the animals in strong flesh than would be the case were they handled somewhat differently.

The writer is a great believer in outdoor air, sunshine and liberal feeding in handling fine breeding stock. I believe that in the south no breeding animal should be confined in a stable at any time except when the young are expected, and then only when the weather is such as to actually endanger the life of the recently dropped animal. We have a herd of cattle that have been in a shed only twice the past winter; the animals have slept right out on the sod under the stars. Fed liberally upon pea and soy bean hay, the herd has been entirely free from the coughs and colds that so often accompany barn feeding. More feed has been used than would have been necessary to keep the animals in the same flesh had they been confined in a warm barn, but we feel that we cannot run the risk of having our animals become weakened in constitution because of a desire to save a little on the feed bill. And it is no hardship to the cattle, this out-of-doors living any mo re than it is a hardship to men to sleep out in the air. The animals have a "snap and go" to them that they never have when confined in a warm stable and this strong constitution is a great factor in a profitable live stock business.—A. L. French in Progressive Farmer.



KING COLE TEA
More zest in your tea-cup!
More smack in its delicious enjoyment!
At last, expensive study of flavor-blending has perfected a fullness, a richness, a smoothness of flavor that was once thought impossible.
Why it was thought impossible one sip of a cup of King Cole Tea will tell you. It is so much nicer, so far more satisfying in the grateful fullness of its flavor than any tea you ever tasted.
King Cole tea is flavor-fuller.
YOU'LL LIKE THE FLAVOUR

The Scrub Bull.

The Iowa supreme court has held that the owner of a pure bred cow that is got in calf by an ill-bred and unpedigreed bull while running at large, may, in an action at court, recover damages from the owner of such bull, which damages are to be measured by the difference in the value of the cow for the purpose of breeding fine stock before meeting such bull and afterwards. We believe breeders of pure bred stock would save trouble in the long run if they would notify neighbors who permit bulls to run in adjoining pastures that they will hold them strictly to account for any damages sustained in case these bulls break through into their pastures.

The success of the breeder of pure stock depends upon the integrity of his breeding operations. If he dilly-dallies in this matter of neighbor's bulls breaking into his pastures, he not only suffers the damage they cause by getting some of his pure bred cows with calf, but he suffers still further damage in having his methods called in question. In some cases, where the neighbor has only a few cows to breed, the pure bred breeder could much better afford to offer to breed these cows to his pure bred bulls for nothing rather than incur the risk from a scrub bull running next to his pasture.—Wallaces' Farmer.

The above portrays quite well the serious annoyance many farmers are subjected to who try to raise pure bred cattle next to a farm where the owner lets his scrub bull run loose with his cows.

Calves Sucking Ears.

One of the most difficult habits to overcome in a bunch of young calves is that of ear sucking. When we feed calves milk from the pail they eat so rapidly that they fail to relieve the mouth of the saliva which natural,y mixes with its mother's milk while it is sucking.

In order to relieve their mouths of this secretion which their organs of digestion demand, they will seek something to suck which will relieve their mouths of the saliva which has been retained to a large extent, and their favorite object is the ear of the calf next to them.

Unless this is prevented the calf is likely to grow up with the habit of sucking itself when it becomes to be a milk producer or sucking the other cows in the herd.

The only way to prevent this vicious habit is to tie each calf by itself until digestive organs have developed sufficiently to enable it to digest grain food, such as ground oats and wheat bran.

Then they will eat dry bran and ground oats and in that way relieve their mouths of this saliva. After this they may be turned together and there is little danger of their acquiring the habit.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for wharf at Beaumont, N. B.." will be received at this office until 4 p. m. on Tuesday, October 10th, 1911, for the construction of a wharf at Beaumont, Westmorland County, N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of Geoffrey Stead, Esq., District Engineer, Chatham, N.B.; E. T. P. Shewen, Esq., District Engineer, St. John, N. B., and on application to the Postmaster at Beaumont, N. B,

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature. the nature of the occupation, and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works equal to ten per cent of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order

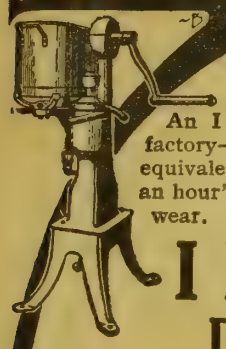
Bigger Cream Checks Sure For Years To Come



Just because a separator skims close is not sufficient reason for buying it. Equally important is the question of durability.

An I H C Cream Harvester was put to a year's test at the factory—running steadily for 10 hours every working day. This is equivalent to 20 years of ordinary use, figuring on a basis of half an hour's daily service. Yet in all this time there was no perceptible wear. What better proof of I H C durability can you ask?

I H C Cream Harvesters

Dairymaid and Bluebell

have been paying cow owners big dividends for years. Their skimming qualities are unequalled—their ease of turning—ease of cleaning—and durability are easily proved by the testimony of owners. Why not investigate?

You will find that I H C Cream Harvesters are the only separators with dust-proof gears, which are easily accessible. The frame is entirely protected from wear by phosphor bronze bushings. The I H C has large shafts, bushings, and bearings. The patented dirt-arrester removes the finest particles of dirt from the milk before the milk is separated.

I H C Cream Harvesters are made in two styles—Dairymaid, chain drive, and Bluebell, gear drive—each in four sizes. The I H C local agent will be glad to point out the above features and many others, or, write nearest branch house for catalogues.

MAXWELL'S HIGH SPEED CHAMPION

Is The Most Satisfactory Washer Ever Placed On The Canadian Market

Last year, Maxwell's "Champion" was the recognized leader of all high speed washing machines. This year, we have put the final touch to it, and offer you the ideal machine, that includes every important improvement known to modern washers.

Maxwell's "Champion" has the largest opening of any washing machine. As you can see, the Wringer attachment is at the side, and practically the whole top of the washer opens up. This makes it easy to put in and take out clothes.

No other washer has this feature. No other washer can be worked with crank handle as well as top lever

In design, finish and appearance—in ease and quickness—in service and durability—Maxwell's "Champion" is the peer of them all. If your dealer does not handle it, write us for illustrated catalogue.

Have better butter. Use Maxwell's "Favourite" Churn. Recommended by best butter makers the world over. More of them used in Canada than any other. All sizes from ½ to 80 gallons.

Calf Breeding.

In answering a question as to what is a good ration for a calf that must drink seperated milk. Prof. T. L. Haecker of the Minnesota station states that, where clover hay, clover and timothy hay, shorts, bran and oil meal are the available feeds, all are good for young stock and for milk production as a liberal supply of protein is needed for both purposes.

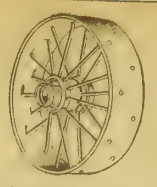
For calves clover hay is preferred. The grain mixture may be composed of two parts each of bran and shorts and one part oil meal. It would also be well to add two parts of corn meal as it is easily digested and adds the carbohydrates needed. No matter how carefully the feed is balanced the calves will not thrive satisfactorily unless the milk is fed with great regularity as to quantity and temperature. They should also be fed out of clean pails. They should be fed in small stanchions when the milk is given. This should be followed by a little grain feed so they will not get in the habit of sucking each other's ears. They should be fed hay out of a rack so they will not get it under their feet. If calves are given only as much as they will eat up clean they will learn not to mess over and waste their feed. With properly cured feed fed in right quantity everything will be cleaned up in a short time.

Recently the writer inspected the mangers of 38 calves born the last week in May and in only one was there any feed left. They have always fed in stanchion, each having its own manger and the hay, grain and silage weighed out to each calf. Everything is eaten and the manger licked clean. They have the proper habit. In another barn another lot of young things have always been fed in an open manger. One of these calves will waste more feed than the 27 fed in the stanchions will waste in a week.

The writer has for thirty years made a special study of calf rearing and has made it a practice to daily personally inspect them and note their behavior. Regularity in all things, clean mangers, clean quarters, uniformity in quantity of feed, are the fundamentals in successful animal rearing.

Soon we will have some 50 new born calves to rear. We have choice upland prairie hay, corn, oats, bran and oil meal. We also have a limited supply of skim-milk. These feeds may seem ample, but experience has shown that it is best to have on hand blood meal and bone meal. So half a ton of the former and a ton of the latter have been added to our store of feed. A teaspoonful of blood meal in a small mess of milk gives satisfactory results notwithstanding the fact that it costs $65 per ton. They also have access to a mixture of salt and bone meal, equal parts. If they grow rapidly, they need the bone for building bone. Having access to this mixture, they never get in the habit of gnawing boards and bark. Persons rearing colts also should bear this in mind. In fact, all animals in gestation should have access to it.

Of all the means of successfully warming a chilled pig and restoring his interest in things earthly, probably there is nothing better than a pail or other vessel of water heated to about 95 to 98 degrees F., in which his body and limbs can be submerged for 10 to 20 minutes. In many instances it will well-nigh revive the dead. If after this hot bath Mr. Pig is dried and placed [illegible] n suck a well-filled te[illegible] the future will be [illegible] d.—"Swine in America



These Mighty Wheels are Tried and True

Thousands of users testify to the superiority of T-K Wide Tire Steel Wheels. They have four times the strength and durability of ordinary wheels—defy the worst roads, rocky, sandy, hilly or muddy, and lighten the draft on horses from 25 to 50 per cent.

T-K Wide Tire, Steel Wheels and Handy Farm Wagons

Our wagons are designed especially to meet the demands of farmers for a wagon to do all kinds of heavy work on the road and around the farm. They are built low for ease of loading and unloading, and will roll over the ground with the heaviest load without tiring the horses.

Write for descriptive catalogue telling how T-K vehicles and wheels will earn more money for you

Gates' Certain Check.

An article that gas rel mrrit should in time become popular. That such is the case with Chamberlain's Cough Remedy has been attested by many dealers. Here is one of them. H. W. Hendrickson, Ohio Falls, Ind., writes, "Chamberlain's Cough Remedy is the best for coughs, colds and croup, and is my best seller." For sale by All Dealers.

THE HORSE.

Growth and Decay in Horses.

Recently a querist, giving the height of a filly foal at thirteen weeks old, and also that of its parents, between which there was a difference of 3 hands 3 in., wanted an opion as to the probable height of the animal at maturity. What height a foal will attain when fully grown, and how long the horse will last under normal conditions after having attained maturity, are questions of considerable interest to breeders and horse owners. The subject does not appear to have been exhaustively investigated, and the evidence available up to the present is not of great value; but General Fred Smith, in his "Manual ofVeterinary Physiology," gives some data that can hardly prove other than interesting.

He points out that the young of the herbivora very rapidly shake off the helpless condition in which they first find themselves in this world, and that is largely due to the fact that they are born with a nervous system in a high state of development. The foal is born in full possession of its senses, such as sight, with an amount of intelligence which nearly, if not quite, equals its parent, and in the course of a few hours it can stand and walk, and in a few days skip and run.

Not only is the nervous system in an advanced state of development, but so is the locomotor apparatus. Dealing with this, Smith says:— "The legs of the foal are remarkably long, some of the bones being nearly their full length, though, of course, not their full weight; such joints as the knee and hock have very little to grow.

The length of leg in the foal is undoubtedly for the purpose of enabling the animal to reach the mammary gland.

"The limb, however, is only partially developed; from the knee and hock to the ground it is nearly the length of the adult; from the knee to the elbow, and the hock to the stifle, it is decidedly below the adult; while from the elbow to the withers, and the stifle to the croup, the body has a considerable amount to grow. It has been said, and the statement appears to be true, that the future height of the foal may be ascertained by measuring the fore limb from the fetlock to the elbow and multiplyiny it by two."

Those concerned to know to what height a foaf is likely to attain should make their measurement a short time after birth, and it would assist in the collection of facts if breeders would record results.

Bonsaingault's inquiries into the rate at which the foal increases in weight, and other circumstances connected with its nutrition, and Percivall's observations on the rate at which some horses of his regiment grew are quoted. Bonsaingault found that the mean weight of the foal at birth was 112 lb., that during the first three months the daily increase was 2.2 lb., from three up to six months the increase was 1.3 lb., and from six months up to three years of age the increase was at the rate of .7 lb. per diem. The growth of the body implies an increase in weight and height, and from what has been said, it may be judged that the amount of growth of each part is not the same. The vital organs, owing to their relative large size at birth, grow less rapidly than the skeleton and muscles. The least increase is in the eyes and ears, and the limbs below the knees and hocks.

Percivall's table, which he considered very imperfect, showed that the increase in height between two years

(Continued on page 878).

PROCLAMATIONS

To The Electors of Canada

"OPEN YOUR EYES" and do not be deceived by the misleading reports published in some of the papers of the Canadian Press claiming that in event of a Canadian navy being established you would be compelled to fight in defence of England should she become envolved in war with a foreign power. These reports are false and were circulated by unscrupulous Politicians to further their own ends in various ways.

"USE YOUR BRAINS" "VOTE AND PRAY" as your heart dictates and refuse to become the tool of any politician "Navy or no Navy". The truth of the matter is this, you will never be compelled to take up arms to aid in the defence of the "Mother Country" should she be threatened by another power, but should the Empire become envolved in a foreign war and need aid "Canadians" would be first to offer their services to the "Mother Land" and fight to the death in her defence as they have done in days gone bye.

"LAURIER AND BORDEN"

They may differ regarding the policy to be carried out in building a "Canadian Navy" and the creating of a "Canadian Army" but the "ELECTORS OF CANADA" may rest assured that the only war in which they will be called to take part, will be war against the diseases of the horse. Every man should enlist and fight for this noble animal. The only ammunition you will need with which to fight the diseases of the horse are

Dr. J. Woodbury's Horse Liniment

Which cures Coughs, Colds, Distemper, Strangles, Colic, Strains, Sprains, Contracted Feet, etc.

Dr. J. Woodbury's Condition Powders

which will purify the blood, remove worms, prevent yellow water and put hair in a glossy condition.

POULTRY.

Quality in Eggs.

It is the city consumer that provides the market for new-laid eggs, and it is the extra price that these bring that gives the producer the profits from his flock.

One must live in a city to fully appreciate the value of a high standard egg, and his appreciation will be the keener if he has a neighbor who keeps a few hens and can spare him a small nest from time to time. It is when he can compare these at his own breakfast table with the best that he is usually able to buy that he fully appreciates the quality of a prime new laid product.

There are however, differences in new-laid eggs that determine their market value. Purchasers prefer large eggs and those of good shape and appearance, and when to these qualities are added the confidence of the purchaser in getting only prime goods, we have reached a point that affords satisfaction and profit to both producer and consumer.

All good grocers are usually able to offer guaranteed new-laid eggs, but the grocer has to take the word of someone, and unless a purchase contains a really bad egg there is not likely to be much complaint. The building up of an extensive trade in high priced eggs depends, after all, on the producer, but poultry-keepers endeavoring to do this single handed find the undertaking slow and troublesome. They must find the consumer who appreciates the good quality of his eggs sufficiently to pay the extra price they are worth. It requires the co-operation of producers to build up such a trade to an extent that is worth while. Co-operative poultry associations working to a high standard will very soon have the quality of their goods recognized so that consumers will soon ask for and demand the stamped eggs of such a concern.

The Old World is ahead of Canada in the marketing of eggs. In the shops of Germany, and Danish towns and cities, one sees upon the counters and in the windows eggs classified according to size and color. The larger ones weighing 17 lbs. to the ten dozen are always quoted higher than those weighing 14 lbs. or 15 lbs. per ten dozen. The difference in price is considerable, and yet the cases of large eggs have to be replenished most frequently. The eye is the inlet to the pocket. In the matter of standardizing eggs the co-operative associations have an important work. As a basis for setting a standard the following considerations deserve attention:

Eggs form a pershible product.

Eggs rapidly deteriorate, varying somewhat in accordance with the conditions under which they are kept, but nothing can prevent deterioration:

The egg contents change in accordance with the time they are kept:

Eggs decrease in value every day after they are laid:

Not every new-laid egg in point of time is a first-quality egg:

Appearance, as in everything else, has considerable money value in eggs.

Having in mind the above points an attempt should be made to build up a standard for first grade eggs, taking into consideration size, shape, evenness, and strength of shell, bloom, color of shell, 'new-laidness,' fullness, brightness, the white and the yolk ligaments, and color of yolk.

Size.—In European cities where standardized eggs are sold, consumers demand, and retailers must supply, eggs which each weigh 2 oz.—i.e. 15 lbs. or over for 10 dozen, and in some markets 17 lbs. eggs are preferred.

Shape.—In this respect there are considerable differences. Some eggs are long and narrow, others almost as broad as they are long, whilst still more are between the two. The last named are preferred, though this is not of great moment so long as the shell is even and not abnormal. Anything in the direction of malformation militates against the value. We may not be able to control, but we can select.

Evenness and strength of Shell.—Roughness of the outer envelope is undesirable. In the autumn and winter a rough shell generally denotes preservation by lime-water; therefore the smoother the better. A proportion of edible matter to the total weight is less than is the case when the calcareous covering is thin, but such is more than compensated for by the fact that there is less evaporation if the shell is close and thick, and the carrying quality is greater.

Bloom.—A new-laid egg has a bright, shiny coating to the shell which is called 'bloom,' and hence it is that experienced buyers can tell the age more or less by its appearance. For that reason washing is useless for the best trade.

Color.—Consumers, and therefore retailers, like a fair priportion of brown eggs, as they are called, and prefer to deal with those who can supply them. It is thought in the scarcer months that these are less likely to be preserved.

'New-laidness.'—This rather awkward term expresses more than freshness. The buyer may be misled by the outward appearance, but the ultimate judgment depends upon the egg contents. That the quality can be gauged through the shell is unquestionable. For that reason testing by light is universal. If we boil an egg when, say, one or two days old, it is found that the white does not inspissate to the extent that it will later, but remains milky, clothy, and flaky. Do what we will, the elements which make for that state disappear in three to five days, when an egg betokens its age. Something has gone which makes for flavor and quality. Such eggs do not command the top prices. The market will not pay the best rates for eggs which have lost their pristine virtue.

Fulness.—One sign of 'new-laidness' is that the egg shall be full, by which is meant that the air space is scarcely visible. Observations as to the evaporation of eggs showed that under normal conditions, out of 120 eggs, the weight of one egg contents disappeared in the first six days, two egg contents disappeared in 13 days, three in 21 days, four in 29 days, five in 36 days, six in 47 days, and seven in 60 days, so that as a matter of weight this is important. The test referred to was made in cool weather. In the hot months, or if kept in a warm place, the loss would be much greater. Examination by light reveals the size of air space, and if that is large the value is depreciated.

Brightness.—By this is meant clearness of contents through the shell, not dull opaqueness. There must be no spots which represent moulds, or dark areas, generally betokening development of the germ or bacterial colonies in the white.

The white and the yolk ligaments (chalaze) must be strong and firm, and also the yolk round. A flat yolk means age. These are not revealed until the shell is broken.

Color of Yolk.—The best eggs have a reddish-yellow yolk, not pure yellow. Again, that is not ascertainable until the shell is broken.

Infertile eggs keep better than those which have been impregnated. If infertile eggs could be guaranteed for market purposes they would soon win favor. Large producers may easily secure this result, and small ones also if they set themselves to do so.

The value of an egg is fixed, not on the farm where it is laid, not even in the local Co-Operative Society's packing-room, but by its condition when delivered to the consumer. An egg which might be first quality in Peterborough, may be only second quality in Montreal a day or two later.

It must be even remembered that values are determined by the extent to which the supplies meet, or fall below the demand. Such as fail to reach the standard must be marketed accordingly, and whatever prices are obtainable accepted for them. If a round price is accepted it will generally be that of the lowest grade, which means loss of returns.

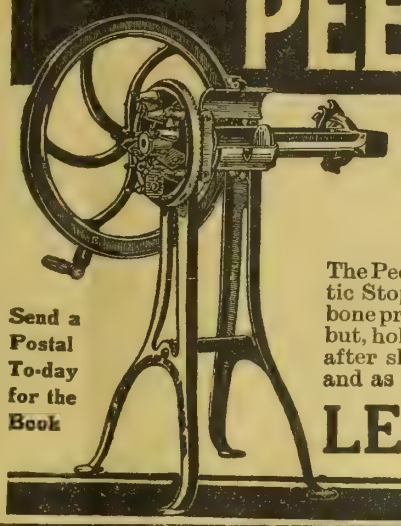
Handle Fowls Gently.

When forced to handle fowls, do it gently, so that they will not be injured or worried. For instance, when moving a setting hen to the place you expect her to set, away from the other fowls, go gently to the nest at night, have a lantern, and remove her gently from the nest and tuck her head under your arm and take her to the nest; sit her down by the front of it and she will at once go on the eggs and nestle down on the eggs, which, by the way, should be china eggs. The nest box should be so arranged that she can be closed up and left for at least one day. Then open the front and put feed in front and she will come off and eat and drink. If she goes back when through put the eggs under her and leave her alone. Do not take her by the foot with head hanging down. It may injure her and prevent her from staying on the nest.

If she has mites of any kind, dust her with some good insect powder, and repeat just before the chicks hatch. Do not use grease, as it will prevent the eggs from hatching. When the eggs begin to peep do not worry the hens except to remove the shells, which can easily be done by putting the hand under her, without taking her from the nest. What applies to setting also applies to all the other fowls when you are forced to handle them.

Frightened Hens.

A few years ago I had a man who could not endure the sight of a hen about the buildings. Every little while a valuable Leghorn would be brought in with a leg or wing broken. The man's excuse was that the horse had stepped on it. I have since become convinced that he had injured the fowls by throwing things at them. I have not been troubled in that way since this man went. While he stayed I was at a loss for a long time to learn why the hens did not lay well. At last I discovered they were in the habit of hiding in any out-of-the-way place when this man was about the buildings. In order to lay, a hen must be active, but must not be afraid to venture out. During this man's stay I received small returns from my poultry. A hen is a good deal like a cow: she likes to be let alone to wander at her own sweet will wherever she pleases. The good cow will go off by herself in the pasture and crop choice bits in the fence rows. Just so with a hen, which is naturally a peaceable creature on the farm. Given her liberty, she is always busy when happy, and happy only when she is not afraid. When she is under foot it is because she is minding her business, looking for something to manufacture into eggs. From my knowledge of hens and from my experience with this man, I would advise anyone who has a hired man not fond of poultry to ship him to some farm where poultry is not kept. Make any kind of concession to let him go if money is to be made out of fowls.—Magadalene Merritt, Albany County, N. Y.



PEERLESS GREEN BONE CUTTER

For half the cost of wheat, you can feed your flock succulent green bone—the most perfect egg-producing food known. A pound of green bone, costing but a single cent, will feed 16 hens for a day. Per hen, that is only

1/16c. PER DAY

Send a Postal To-day for the Book

The Peerless Positive Feed and Automatic Stop Green Bone Cutter cuts green bone properly; it does not grind the bone but, holding it endwise, cuts off shaving after shaving—as bone should be cut, and as it is most easily digested and assimilated. Write for our book—sent FREE—telling all about how to feed green bone to your flock, about its economy, its muscle-forming values and its wonderful egg-producing properties. A postal will bring it to you. 101

Love's Barrier.

(Continued from last issue)

CHAPTER IX.

MAN AND WIFE.

"I DON'T want to hear any more about the parish," said Helen listlessly. Talk to me about something human. Tell me more about your sister."

They were walking together on the Brighton front, whither in the gusty December weather they had come to spend their brief, strange honeymoon Helen would have preferred had they gone straight to Midcar, seeing no reason why they should shrink from the ordeal which had to come sooner or later, but Secretan had claimed these days. Sometimes he was strong with a strength which, had Helen loved him, would have filled her with a secret pride. As it was, she thought vaguely of the conflict which was inepitable when two strong wills should be pitted against one another.

She turned her eyes to the grey sea which, flecked with foam, stretched away to the horizon, in a dismal wideness, an endless gloom. The weather was having its effect on the opening Brighton season, and they were almost alone on the windswept front. They had been married just three days. Secetan, looking at the clear fine outline of her face, felt his pulse beat hard. She was passing dear to him, the floodgates of being, long pent, threatened to overwhelm him, and were only kept in check by the bar of her aloofness. Her face was hard, her expression quite grave. Secretan did not grasp the fact that she was beginning to realise the portent of what she had done, and was a little appalled.

Full of his work for the future, of the life they were to share, he was naturally inclined to talk about it all, to seek to enlist her sympathy. But he was obliged to admit that, so far, she had lent but a languid ear.

She was very gentle and quiet, grateful for his tenderness and consideration, but there was fear in her eyes. How was she to walk by this man's side, give him the comradeship he would undoubtedly expect, with a heart cold to him as the nether mill-stone? That was the problem in front of Helen Secretan now, and all the warmth of the new-made husband's devotation could not solve it for her.

"There isn't much to say about Jane, dear," he said with a somewhat awkward laugh. "She is a very commonplace person. In fact, I rather think I am a little apprehensive about your meeting."

"Why? Won't she be pleased to see me? That was a very sweet letter she wrote. I have it here."

She patted her breast with her fingers, and Secretan looked the surprise he felt.

"I am glad she wrote kindly, but there isn't an ounce of sentiment about Jane. I should call her the embodiment of common sense."

"But how valuable! So few of us have any common sense! I am sure you and I haven't an ounce between us. If we had, we shouldn't be here to-day."

"But you are not regretting it already? he cried jealously.

"Oh no, I don't think so. At least I would not go back, but I have tried to be quite frank with you all along. Claude, I am not cut out for a clergyman's wife. I shall make endless mistakes. I want Jane to go on doing the work of the parish."

"But dearest, she can't. She is leaving the Rectory immediately we go back."

Helen stood stil, on the broad sweep of the pavement, where it suddenly swerved at the end of the Hove Lawns, and looked straightly at him.

"I won't have her leave the Rectory, Claude. I told you quite frankly that it was one of the conditions that your sister should remain. I told her, too, in the letter I wrote to her. Did she show it to you?"

"No, I did not even know that she had received it."

"I think I'm rather glad she didn't show it to you. Do you know what I feel about your sister, though I have never seen her? That she is going to be my strong rock of defence."

"But I don't quite see what you want with a strong rock of defence," observed Secretan good-humouredly, but with a little contraction of his brows. "Against the domestic tyrant, do you mean? I have heaps of faults, but I don't think you will find me that."

"Don't willully misunderstand or twist my words," she said with colour a little heightened. "Our—our arrangement will want skilfu, handling, I foresee. What I want you to understand is that you will find me incapable of working in the parish. I will do what I can. I am neither idle nor stupid, and I believe I can promise that I will not make a fool of myself or of you, but I must be left alone."

"You shall be left alone," said Secretan gallantly, for he foresaw no difficulties whatever. "And I rather think from what I know of you now that Midcar is going to interest you. It is full types, quite homely types, but they are a kindly folk, though rough, and a trifle outspoken."

"Oh, I shall not mind the people, if I am not expected to live up to the position of a clergyman's wife. I couldn't take mothers' meetings, or attend prayer meetings or anything of that sort. You will please remember that I have not pretended to be good, or to believe in anything."

"All that bitterness has arisen out of the bitterness of your life hitherto," he said, with his air of quiet tenderness, of assured knowledge. "It is going to be different now, and your sweet nature will expand in the different atmosphere when you are among people who will always love and appreciate you."

"You are sure I have a sweet nature. I am by no means sure. It is strong and capab,e of—of vindictiveness. We shall never be so vulgar as to quarrel, I hope, but——"

"To quarrel!" cried Secretan. "My dear, it is unthinkable!"

"It has been known to occur in fairly well-regulated households before now," she said with a small cynical glance. I foresee already that we shall have to agree to differ on a great many points, and it will be easier if your sister is there."

"It would certainly not be easier for me," answered Secretan quickly, and with a touch of gloom. "I want to be entirely just to my sister, because she has been a true angel of goodness and self-sacrifice all the years we have been together; but she has her limits. They happen to be very narrow limits. I hate to tell you things, dearest, but it is necessary to prevent misunderstandings. My parents were quite poor people, and my sister has not been well educated."

"But you have," put in Helen quickly. And she has had to stand aside?"

"Well if you put it so, I suppose it is true. But she felt the deprivation, if there was any, less than most. She has few or no intellectual gifts. She is only a plain, honest, useful woman, at home in a moorland cottage with an ailing baby on her lap, or talking to factory girls about their extravagant clothes. But she has never taken up a position in the place, and I have been very much alone. People have understood, and asked me without her."

"Then I think it was abominable of you to go," said Helen calmly. And I'm sure I shall not want to know such rude and stupid people. You can go on dining out by yourself, and Jane and I will spend long,quiet, lovely evenings together."

It was not quite a kind speech, but something goaded her to it. Sometimes the bitter edge of a very caustic tongue gave Secretan an uncomfortable pang. He had not been used to assertiveness in women; the few with whom he had been intimately associated had been of the self-renouncing order, and he had lived in the atmosphere thus created as if it were his right. Helen, a woman of the world, possessing a keen intuition and a cultivated perception, had already probed the weak joint in his armour. And she was quite ready for fight.

Secretan merely threw back his head and laughed a boyish spontaneous laugh at the idea of his wife and his and the Rectory evenings. Helen did not know what she was talking about, of course. He must humour her until experience taught her.

Helen was oddly nettled by his laugh, though it was indeed a singularly pleasant sound.

"I don't see anything to laugh at. You are silly and rude as well. I foresee that my mission in Midcar may be the canonisation of Jane."

Secretan was silent a moment. Did he know that already Jane was canonised in the people's hearts by every law of love and loyalty and gratitude? He had yet to learn that her blessed ministry was the buttress nay, the foundation-stone of his own, and that bereft of it, he would find himself a poor thing, until he realised at once his own limitations and his strength.

It was astonishing what lessons life teaches us until we have reached the acme of all: "Know thyself."

"I foresee the conquest of the West Riding by yourself," he said, moved to a lover's tenderness again by the lovely flush on her face. "It will simply be at your feet."

"But I don't want the West Riding at my feet. I don't want anything to do with people who have been stupid. I will not have their patronage, nor their dinners."

"But they are very nice, dear, all of them. My best family, the Hayes of High Ridges, will show you great kindness."

"Who are they?" she forced herself to ask, remembering suddenly that she was falling very far short of the line she had marked out for herself.

"He is one of the biggest manufacturers in the West Riding, quite new people, but he is one of the most charming of men. His wife is, well, just a little impossible; her object in life, to get into the county, is a little too obvious. But that will amuse you probably. She is really quite a kind and generous-hearted woman, and they have the prettiest daughter you ever saw. Her name is Audrey. Her father thinks her the sweetest thing God ever made."

Quality

in tea may mean to you flavor or strength or fragrant richness. Red Rose Tea is blended with such nicety that it is the combination of all three points of merit. Will you try a package.

AFTER 7 YEARS SUFFERING

I Was Cured by Lydia E. Pinkham's Vegetable Compound

Waurika, Okla.—"I had female troubles for seven years, was all run down, and so nervous I could not do anything. The doctors treated me for different things but did me no good. I got so bad that I could not sleep day or night. While in this condition I read of Lydia E. Pinkham's Vegetable Compound, and began its use and wrote to Mrs. Pinkham for advice. In a short time I had gained my average weight and am now strong and well." —Mrs. SALLIE STEVENS, R. F. D. No. 3, Box 31, Waurika, Okla.

Another Grateful Woman

London, Ont.—I feel as if I could not tell others enough about the good Lydia E. Pinkham's Vegetable Compound has done for me. I was so weak and tired that I could not rest nights. A friend recommended your Compound and I soon gained health and strength and could not wish to sleep better. I know other women who have taken it for the same purpose and they join me in praising it.—MRS. WM. A. BUFFY, 905 Dame St., London, Ont.

Lydia E. Pinkham's Vegetable Compound has surely cured many cases of female ills, such as inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, that bearing-down feeling, and nervous prostration.

"Why didn't you marry her, Claude?

"Marry her! It never occurred to me! She is a mere child, just out of the schoolroom; besides, they aim at something higher. We are not a ducal county, but, if we were, nothing but the coronet would satisfy Mrs. Hayes for Audrey. Mr. Hayes was the only member of my church I personally told about my marriage, and he gave me a cheque for fifty pounds for a wedding present. I thought we might add something to that and buy a piano. Helen, there has never been one at Midcar Rectory."

But Helen's interest continued languid. Try as she would, she could not get up that interest in details which the happy woman, wed for love, takes in the smallest item pertaining to the new life she is to share with the man of her choice. Suddenly her face lost the hard look, and became very sweet and tender.

"Claude, I'm afraid I shall be a trial to you. I am very much afraid we are going to discover that it has been a mistake. I ought not to have let myself be persuaded to have taken advantage of your—your generous kindness. I am very sorry, dear—and a little afraid."

They were quite alone on the wide-swept promenade before the Hove Lawns, and Secretan, mightly moved by her sudden change of mien, threw his arm round her and bent his face passionately to hers.

"Darling, nothing matters so long as you have given me the right to care for you."

She drew herself away very hurriedly.

"You—you promised, Claude I can't bear very much of this. It was not in the bond. It will be better that we should get home as soon as possible. Let us go to Midcar tomorrow."

But that did not fit in with Secretan's arrangements, which had something of the bachelor's method about them. He compromised by taking her to London next day, where there were more diversions, and where it was easier to keep away from personal topics. The piano was duly chosen, and Secretan then learned that his wife had a very considerable musical taste, and that she was perfectly capable of making an excellent choice of an instrument.

Two days later they journeyed home.

Helen was very cheerful on the journey, anticipating her meeting with Jane, but as the train sped northwards Secretan's nervousness seemed to grow upon him.

"I am afraid you will be very disappointed, Helen, in your new home. I mean it is bare, it is not at all pretty."

"Perhaps I shall be able to make it so," she suggested, cheerfully nodding across the compartment towards him. "Don't look so gloom. It will be time enough to grumble when I pull a long face over it, won't it?"

She became almost gay, and when the train drew up at the junction where they had to change into the little train that took them over the upland line to Midcar, she jumped up, all alert.

"Are we there? What a lovely evening! Just look at that sunset! There is somebody bowing to you, Claude; who is it?"

"Mr. Hayes. Do you mind if I introduce you, Helen?" said Secretan with a slight flush. "Probably he will expect it, and we have a few miles to go yet in the little train, but if you would rather not, I dare say he won't mind."

"Don't be silly, Claude; of course I want to be introduced. I like the look of him, he has a nice, kind face. My umbrellas and sticks—yes, that is all."

She sped lightly from the carriage to the ground, and stood ready and smiling to be introduced to the first of her new friends.

Afterwards Helen often recalled the pleasure of that meeting, the particular sense of well-being and comfort which enveloped her, when Geoffrey Hayes, taking both her hands, held them warm and close, and looking into her face with his honest, kindly, grey eyes, bade her thrice welcome to the West Riding.

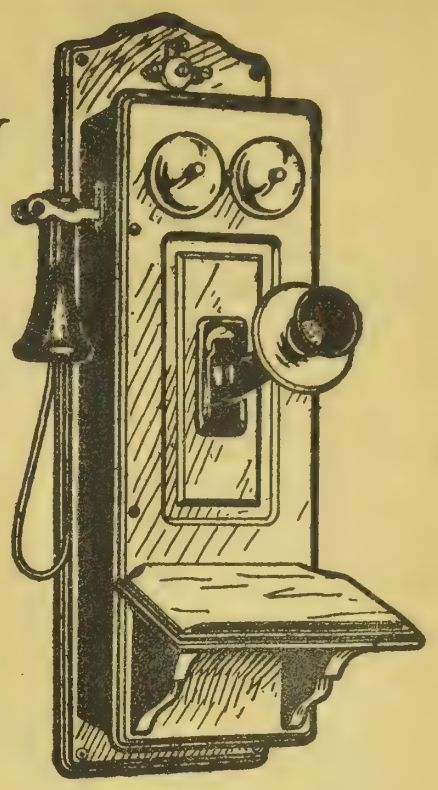
The warmth of the welcome indeed took her breath away. He was not a large man, but he imparted the sense of power. His figure was a little short; beside Secretan's splendid height it appeared even more striking, but his shoulders were broad and square, and there was a sense of strength and power as well as the confidence of an assured position, which were particularly pleasing to Helen. She hated the invertebrate in man or woman; even disagreeable qualities were preferable.

"So this is the lady who made such short work of the celibacy of the clergy," he said with a sly twinkle in his eye. "Well, I understand it better than I did. I am very happy to meet you, ma'am. God bless you, and give you long life and happiness; you have married one of the best of men, and we in the West Riding know it. Welcome home."

It was a big welcome—warmth, friendliness, promise, all were embodied in it. Helen's heart expanded, her eyes responded to the kindly gleam in those bent upon her. Her fingers returned the warm pressure, she murmured in a voice that had a little thrill in it how grateful she was. Somehow she remembered her father, and something of the sheltered feeling she had in her girlhood crept sweetly back about her heart.

She never afterwards lost that sense of security and well-being Geoffrey Hayes's presence, and when the clouds gathered thick and dark

Our Telephones Chosen by Majority Of New Systems



IN Ontario where the fight for business is keenest—where all telephone manufacturers enter into competition—this company has assumed a commanding position. This year The Majority of municipalities and new companies entering the independent telephone field selected our telephones and equipment.

QUALITY WINS

Price cut no figure in securing the business of these companies. Other telephones were offered for less. SUPERIOR QUALITY won us the victories.

Our telephones were selected not only by new systems, but by those who had been using other makes, because they were proven to be the clearest-talking, strongest-ringing, simplest and best constructed. They were given the severest tests, the most minute and rigid examinations. They established their superiority beyond question.

BUSINESS DOUBLING

Between 400 and 500 Independent Canadian Telephone Companies are buying their supplies from us. Our business is again repeating last year's record, when it doubled in volume. What better guarantee of satisfaction could a municipality or local telephone company want than the evidence of the satisfaction we are giving others?

10 YEARS' GUARANTEE

Everything we sell is guaranteed. Our Telephones are guaranteed for 10 years against defects in material or workmanship. Our Side Blocks and Top Pins are made specially for us, so as to insure uniform quality. In No. 12 Galvanized Line Wire we never carry anything but the best.

We stock nothing but first quality materials. And we stock them in large quantities.

Notwithstanding our large increase in business, our facilities are such that we are able to handle all orders promptly and satisfactorily. A Price List will be mailed on request.

NO. 3 BULLETIN

Our latest book on telephones has just been printed. It contains the latest, most authentic information on construction and operation of telephone lines. Also shows the most up-to-date equipment. Ask for the No. 3 Bulletin.

If you haven't a copy of our famous book, "Canada and the Telephone," profusely and graphically illustrated by a leading artist, we will be glad to mail you one, too.

FREE TRIAL

If your company is going to replace some old phones with new ones, or is just starting a system, ask us about our FREE TRIAL OFFER, whereby the quality and efficiency of our telephones can be judged before spending a dollar.

Pratts Cholera Remedy is guaranteed to prevent and cure this disease. Pratts Lice Killer will positively destroy lice.

We will mail you free copy of our 1911 Poultry Book on request.

PRATT FOOD COMPANY OF CANADA LIMITED

Dept. 68. Toronto, Can.

about her life, she found in him a steadfast friend. His welcome to Secretan was no less cordial and sincere, and they entered a compartment in the waiting train to complete their journey.

"Miss Jane is expecting you," nodded Mr. Hayes kindly. "And all sorts of mysterious prepartions have been going on in the Rectory. Audrey was to be there the most of the day. Audrey is my little girl, Mrs. Secretan, who winds her old dad round the pink tip of her little finger —doesn't she, Rector? I hope you and she will be friends. But by jove! isn't the county by the ears?"

He continued nodding and beaming at He,en, who, unable to resist the infection, felt herself smiling too.

"We do gossip a bit on these moors, and why shouldn't we? It's kindly gossip in the main, and it's human nature after all. I'd rather take a kindly interest in my neighbour, than be a curmudgeon who wants the whole world to himself.

"Say Rector, the new folks are coming to Mardock's next week. They're even more important than we expected. It seems the new squire is brother to the Duchess Dowager of Eastlake, and that she's coming to keep house for him all winter, so you won't want for aristocratic neighbours, Mrs. Secretan. Mardocks is your nearest big house, but I dare say the Rector has already been explaining the geography of the neighbourhood to you."

Helen gave a great start, and her face flushed a little.

"The Dowager Duchess of Eastlake —why,it's impossible! Are you sure there is no mistake, Mr. Hayes? Last time I heard of her she was in California."

"They both came from there, I believe; then you know the Duchess?"

"She was one of my father's oldest friends," replied Helen quite simply.

"Ah, then, you will be pleased to hear you will have her for a neighbour."

"I can't take it in, quite," said Helen a little doubtfully. "How small a place the world seems to be after all. One never gets quite away, however much one tries."

Geoffrey Hayes contemplated with some inward amusement his wife's frame of mind when he should tell her the Rector's new wife spoke of a Duchess as an old friend. In happy and friendly talk they made the little journey to Midcar station, and there Mr. Hayes left them, to mount to the box seat of his own smart turn-out.

A handful of curious folks watched the Rector and his wife get into the station fly, the luggage was put upon the tray, and they lumbered off. Five minutes more and they had crossed the village street, passed through the Rectory gate, and Jane was at the door.

Woman.

"They talk about a woman's sphere
as though it had a limit;
There's not a place in earth or
heaven,
There's not a task to mankind given,
There's not a blessing or a woe,
There's not a whispered yes or no,
There's not a life or birth
That has a feather's weight of
worth—
Without a woman in it."

Many earnest students of social progress to-day believe and maintain that the human race is now passing through one of many distinct reformative periods of its earthly career, and there is much evidence to substantiate such convictions. Old standards, beliefs and traditions are crumbling and everywhere in the civilized world remarkable changes are occurring in the habits, laws, methods and customs of peoples.

It would be interesting to learn from some authentic source just what part woman is playing in this wonderful social reformation. That hers is an important part no one can doubt who has studied the course of human endeavor for the past few decades. For centuries she has denied the educational advantages given to man. As one writer has expressed it "Woman was bound to the mound of the debris of all ages, the debris of false convictions, outworn lies and useless labors—a victim of false ideas of sex and vain standards of sex ethics."

A little over a century ago women began to enter the professions in which intellect plays a greater part than technic and manual labor. It was when women were permitted to enter the schools and universities that the present reformative period began, and after a century of the freedom to compete with man, we find woman competing with him (in some cases outclassing him) in the fields of business, literature, science and art. But it is the sphere of ethics that woman is most potent in the present reformation.

In the reform movements which deal with the home, the child, the school, intemperance, and the humane treatment of animals, woman is more active and earnest than man. The women reformers do not stand in the spotlights of publicity and notoriety as do many of the male reformers, but their influence is far reaching and their labors are more fruitful.

Woman is the nourisher of the race, and if we are to pass through this great reformative period safely and enter a new era of righteousness, the race will owe as much to woman for its deliverance as it will to man.

When woman stands wholely free and unfettered by the conventionalities to which she has been bound for centuries; when her true mission in the world is thoroughly understood; when the divine significance of the terms "sweetheart," "wife," and "mother" are fully realized by man —then the race will experience a great revolution in thought, and the old lie that woman is an inferior being will give way to the eternal truth that the feminine, or maternal principle in nature or society is as potent for good as the masculine, or paternal.

Let us work to hasten the day by lightening her labors in the ceaseless round of her home duties, and she will reward us by giving us a greater love and better children.

"And round her happy footsteps blow the authentic airs of Paradise."

WHAT! They Need Painting Again?

Let's Buy

Amatite ROOFING

It Needs No Painting

AMATITE has a *real mineral surface;* it needs no paint to protect it. In rain and sun and snow and hail, Amatite takes care of itself. It needs no coddling; there is no maintenance cost. You lay it and leave it.

The mineral surface is durable, permanent, absolutely weatherproof, unaffected by climate, insoluble in water, not injured by smoke.

Amatite is easy to lay. No skilled labor is required. You simply unroll it on the roof, and nail it down with nails which we supply to you. Cement the laps with the adhesive cement which we also supply free packed in the center of the roll.

Amatite costs no more than the kind of roofings that require constant painting. You get twice as much weight of roofing for your money as you do with other roofings.

Sample free on request. Address nearest office.

Everjet Elastic Paint

Save money by using this black paint wherever the color is no objection. Elastic, heat-proof, durable. Use it for roofings and all exposed iron and wood.

Creonoid *Lice Destroyer and Cow Spray*

Spray the hen house regularly with Creonoid to kill disease germs, repel insects, suppress odors and prevent the spread of contagion. Sprayed on cattle it keeps the flies away, and the cows thus protected produce more milk.

The Secret of a Contented Spirit.

By Observer.

Contentment is a virtue which has its root in the home. Not long since I heard a mother bemoaning the fact that her daughter never seemed satisfied with anything she had. "The habit grows upon her, too," the mother affirmed.

Now I happened to know a little about the home life of that discontented daughter, and I was satisfied that this "habit," as the mother chose to call it, was fostered to an extent she little dreamed of by the daughter's home environment. This complaining mother was herself continually striving for things entirely beyond her reach in her present social condition,— not, however, in the way of attainment through honest effort, but rather in a discontented, pessimistic, fault-finding attitude which had developed her into a chronic grumbler.

So fixed had this outlook upon life become, that nearly all her conversation was prefaced by such remarks as: "Now, if I only had the money to spend that Mrs. So-and-So has,—" or, "If my health would only permit, —" or, "Oh, I shall be so glad when this hot spell is over!" "I wonder if it is ever going to stop raining!" and the like.

Scoff at the fact as we may, such moods are as contagious as scarlet fever; and their after-effects are infinitely more deplorable, for unless one recognizes the danger of such a pessimistic outlook, a habit is thus formed which is very difficult to undo; and it is in turn transmitted to those with whom one is daily brought in contact, by that psychological law which recognizes thought forces to be as potent in their effects as that unseen electric current which transmits the message across the continent.

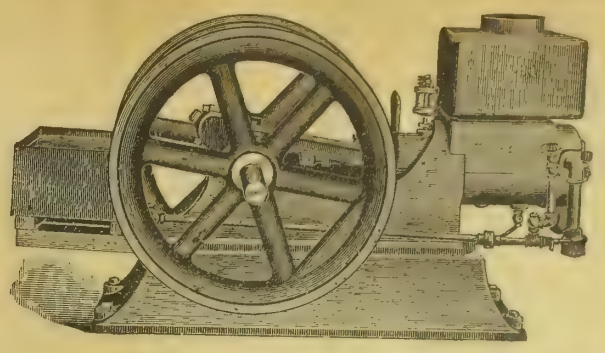
A contented mother usually has a contented daughter. Both by heredity and environment the child of such a mother comes into her birthright. Unseen forces play as important a part in a child's mental education and development as do the more tangible ones that even the dullard recognizes.

Place a child in daily contact with a chronic grumbler and you develop a prototype of this most undesirable factor of humanity by that same immutable law of cause and effect that produces a flower or a weed. On the other hand, surround this same little one with sunny home influences, and without the spoken word of counsel the child will absorb them into its life, as the flower absorbs the sunshine; and you have the sweet and sunny temperament that in its turn radiates light and happiness.

Cooling the Country Kitchen.

In the country kitchen the lack of the convenience of gas and electricity is especially regretted during the hot months of summer, when an even larger quantity of food must be cooked than at any other season. It is true that oil stoves are substituted in some cases, but in too many homes even these are absent, and the housewife is forced to perform her duties over the broiling heat of a wood range, even though the thermomoter stands at the nineties.

The simpliest way out of the difficulty, the serving of fewer pastries and dishes requiring longer cooking, and the substitution of fresh fruit and raw vegetables in salads, is not always kindly received, for the average husband will have his pies, and for salads he cares little. Working men must have substantial food even during the hot months, for their work is even harder at this season than at any other, and the country housewife realizes this and makes a martyr of herself accordingly.



The Waterloo Boy Gasoline Engine

is like a lot of people you and I know. It improves on acquaintance You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new positive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in the winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogne is free. Write to-day.

THE WATERLOO GASOLINE ENGINE CO.

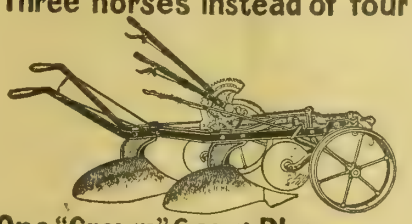
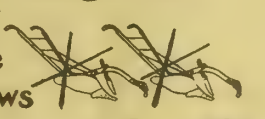
What the "Crown" Gang Plow does

One man instead of two

Three horses instead of four



One "Crown" Gang Plow instead of two single furrow Plows



Make this test: The first day give your hired man a single-furrow plow and two horses. Take another single-furrow plow and two horses yourself. Then, do one day's plowing. Together, you will plow three acres, under favorable conditions.

Next day, use the "Crown" Gang plow and three horses. You'll find that you can still plow three acres.

The second day the same work has been done with one man instead of two, three horses instead of four, one "Crown" Gang instead of two single-furrow plows. What this saving means to you in dollars and cents you can figure out for yourself. But it is enough to pay for the "Crown" Gang in a few weeks.

The "Crown" Gang stays right down to its work. It turns the furrows more evenly than a single-furrow plow. The easy-working levers are conveniently located. The wheels have dust-proof boxes with roller-bearings. You should learn more about the "Crown" Gang right away, and about our special orchard gang plows, too. So write for CATALOGUE

To all women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser." also sent free on request. Write to-day. Address Mrs. M. Summers, Box H. 309, Windsor, Ont.

Then, too, this is the fruit season, when supplies must be put up for the winter months; this also necessitates much standing over a hot stove. One little hint in the making of jellies may help a little; this is the preparation of the fruit for jellies, leaving the finishing for the colder months. It is not the cooking of the fruit which takes time and fuel, but the boiling of the juice to the required stage; and much of the hot work is saved when one learns to put the prepared juice (unsweetened) in cans, when the boiling down may be done later in greater comfort and leisure. Cat- fruit for jellies, leaving the finishing in Winter, if the plain, unsweet- put uo for that pur- cooking of meats and vegetables in quantities, there is no saner method than by the fireless cooker.—Maude E. S. Hymers.

Utensils.

If tin or iron utensils are used in canning, the fruit will become discolored, and a disagreeable flavor will be developed, says Woman's Work. The acids of the fruits acts on those metals and forms chemical combinations with the fruit juices. The ideal utensils for use in canning are enameled or porcelain lined. Kettles for cooking fruit should be large around, as it is better not to have too many layers of fruit at once.

It is of great importance in canning to have the jars, rubbers, and tops n perfect condition. Never use old tops with cracked hinges or old soft rubbers. Some housewives prefer the wide-mouthed jars that seal without rubbers. Pint jars are more satisfactory for a small family than larger ones.

A wire basket for dipping the fruit into boiling water is a convenient utensil, and a pair of scales is not only convenient, but economical.

Mother's Who Don't Know.

"I continually have to deplore the gross ignorance displayed by mothers as to the proper care of their children, not only as to food, but also in regard to cleanliness, dress and other simple matters," said Dr. Bernard F. Fuller of Chicago to a reporter, "and I do not hesitate to say that at least one-half of the cases attended by me and other physicians need advice only and not medicine."

Dr. Fuller in speaking about milk as a food for infants said the best food for an infant is mother's milk, as it contained all the ingredients necessary for proper nourishment and growth. "As a rule, all mothers should nurse their own children," added the Chicago Aesculapius, "except when the mother has or has had consumption or any other chronic disease. The baby should be nursed at regular intervals during the day and once or twice during the night.

"Most of the people these days are affected with acute diseases, chronic ailments, general debility from which they could save themselves with little knowledge. People shut themselves up in close sleeping rooms, never feeling sufficient interest in the matter to ascertain how much pure air is required for one person and even when told that one adult actually consumes 150 cubic feet of air an hour, still submit to the confinement because their parents did, or because they are not conscious of any immediate ill effects. They are afraid of the night air, which might come through an open window of a bedroom, through fear of taking cold. Yet colds are far more likely to result from the sensitiveness produced by sleeping in close rooms than from any amount of fresh air admitted at night.

"The same is true of food. A child's natural food is milk. Yet how often do we hear of a mother boast that her child of one or two years, or even less, eats whatever she does, heedless of the fact, even when told, that the very reason it does not care for milk is that its appetite has been perverted by unsuitable food or drinks.

"The almost invariable mistake made in city homes is that of excessive clothing and too warm rooms. These two things are among the most frequent reasons for taking cold so easily."

FOR YOU—THE BEST CROP INSURANCE IS AN IHC MANURE SPREADER

TO secure the best results, manure must be spread with a machine, because fork-spreading wastes manure, wastes time, wastes energy, and wastes opportunities for increasing the income which a farm is capable of yielding.

In progressive communities you will find that most of the manure spreaders in use bear the I H C trade-mark. Progressive farmers take no chances on their crop insurance. They want absolute assurance before they decide.

Before they bought I H C manure spreaders, they found that they were simple in design—unusual in strength—and remarkably efficient.

They found the power transmitting mechanism the most durable used on any machine, because the beater gear was held in a single casting which prevented the gears from springing out of alignment and cutting the teeth. They found that the long, square, chisel pointed teeth insured positive pulverizing of all manure; that the teeth were long enough to tear the manure to pieces before it wedged against the bars; that the teeth did not rim the bars; that the beater was large enough in diameter so it did not wind. They found that the rollers which supported the apron were large, that the apron moved easily; and that self-aligning roller bearings on the main drive axle not only reduced the draft but prevented the axle from binding, and cutting the axle brackets, a fault not uncommon to spreaders.

IHC Service Bureau

The purpose of this Bureau is to furnish farmers with information on better farming. If you have any worthy question concerning soils, crops, pests, fertilizer, etc., write to the I H C Service Bureau, and learn what our experts and others have found out concerning these subjects.

Corn King Cloverleaf

You have choice of these two styles. Each style is made in several sizes to meet every condition.

Don't plant another crop before you see the I H C local agent. Let him tell you all the facts. Let him point out the many advantages of an I H C spreader. Pick out the one that suits you best. Get catalogues from him, or, if you prefer, write nearest branch house for any information you desire.

WAS TROUBLED WITH

HEADACHE

FOR OVER TEN YEARS
Dr. told him to try

Burdock Blood Bitters

Mr. Henry Sirot, Dumas, Sask., writes: "For over ten years I have been troubled with headaches every morning, accompanied by an acidity or bitter taste in the mouth. Thinking the cause of it was the too great use of smoking tobacco, I have quit the pipe for two months, but it was always the same. I went to the doctor and he told me to try some of your Burdock Blood Bitters. I got a bottle and found quite a relief before I had done with it. I then bought another one and used it all. Now I can say that I am perfectly cured. I used to be without appetite especially in the morning and now I feel as good as a new man. I cannot too highly recommend Burdock Blood Bitters to all persons suffering from headaches and sour stomach."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

DEPARTMENT OF RAILWAYS AND CANALS.

Intercolonial Railway.

MCNCTON YARD AND CUT-OFF

SEALED TENDERS addressed to the undersigned and endorsed "Tenders for Moncton Yard and Cut-Off," will be received at this office until sixteen o'clock on Monday, October 2nd, 1911.

Plans, profiles, specification and form of contract to be entered into can be seen on and after the 4th of September at the office of the chief engineer of the Department of Railways and Canals. Ottawa, and at the office of the Chief Eng neer of the Intercolonial Railway, Moncton.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labour, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $40,000.00 made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security; or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order
L. K. JONES,
Secretary.

Department of Railways and Canals,
Ottawa, September 7th, 1911.

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility, your Wonderful Health Belt cured me. I am a man again. Use my name name as you see fit."

LEON TURPINANT,
Stellarton, N. S.

Perpetual youth. That is percisely what I mean. I say as man to man give my Healt h Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private eymptons of weaeness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physicians if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at small of the back; it cures backache in one application; you feel better immediately; inside of an hour. Two months will make a new man of you. No drugs; no privations: no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality and you will be able to face the world with new ambitions. The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatica, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and wern by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the Belt. No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for anyone needing new vigor.

Dr. D. M. Sanden Co., 140 Yonge Street, Toronto, Ont.
Dear Sirs,--Please forward me your book as advertised.

Was Troubled With Sour Stomach and Biliousness

Miss Bessie O'Leary, Campbellford, Ont., writes:—"I was troubled with sour stomach and biliousness for two years and could get no relief until I tried Milburn's Laxa-Liver Pills. I had only taken them a short time when I felt like a new person, and now I can recommend them to all sufferers."

There are very few people who have never suffered from a sour stomach or biliousness, but to those who are we can highly recommend our Milburn's Laxa-Liver Pills, as they are a specific for these not dangerous but very unpleasant complaints.

The price of Milburn's Laxa-Liver Pills is 25c. per vial or 5 vials for $1.00 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

10 pounds, 1, F. W. Foster; 2, Mrs. J. J. Chisholm, Brierley's Brook, N. S.; 3, Mrs. Robert Ward, Lower Sackville, N. B.; 4, Mrs. H. Johnson, Enfield, N. S.; 5, Arthur J. Marple, Truro.

What is Good Seed Grain?

(Continued from page 857)

The presence of weed seeds not only paves the way for a reduction of the crop, but makes trouble for years to come. By sowing weed seeds with our grains, we introduce them into our fields, where they may be very difficult to eradicate. By their increase from year to year, and the expense which will be necessary to eradicate them, they may cause a much greater loss than that which is more or less apparent in the crop in which they originally grew.

Weed seeds are also very objectionable in the crop which is produced from our seed grain, for their presence causes dockage when the grain is sold at the elevator or the mill, and they are less valuable for feeding than the grain in which they grow. The seeds of some weeds are even decidedly injurious to people and to some kinds of stock, as those of corn cockle. Weed seeds which are removed from grain should be ground very fine if they are fed to stock, and fed with a liberal admixture of good grain, or they should be burned or otherwise destroyed.

FREEDOM FROM DISEASE.

Good seed should be as free from disease as it is possible to make it. Oat smut, and one form of the smuts of barley and wheat, can be killed by the formalin treatment, which consists in treating the seed, either sprinkling or soaking, with a very weak solution of formaldehyde. The forms of smut on wheat and barley which are known as the loose smuts are not affected by the formalin treatment, but can be killed by what is known as the hot water treatment. Full directions for these treatments cannot be given in our limited space; write to your experiment station or to the department of Agriculture for bulletins on the subject, or for explicit directions. An attempt to treat the seed without a full knowledge of the methods may result in failure or in destroying its germination.

Ice Cream for the Farm.

The first essential in making good ice cream is clean, sweet cream. Cream that shows the least sign of sourness, or that has absorbed odors from vegetables or from the stable should never be used. It is desirable to keep the cream as long as possible after skimming, as the older it is the better, providing it does not get stale or sour. It should always be kept as cool as possible. If ice can be had so much the better, but cream placed in the coolest water available will usually keep the desired length of time. Cream that is 24 hours old is better for making ice cream than if freshly skimmed. The cream may, however, be skimmed in the evening, kept cool overnight, and used the next forenoon.

The recipes that will be given call for a 25 p. c. cream. It is not necessary that just this richness of cream be used. Some may prefer an ice cream made from cream testing say 20 p. c. Those having separators usually know about what the separated cream will test. If the cream tests about 35 p. c., two pints of skim milk added to six pints of cream will give the required richness. The ordinary hand-skimmed cream will usually be rich enough.

Fifty pounds of ice are usually ample for freezing and packing a two-gallon freezer. The ice should be broken into fine pieces. It may first be broken into fairly large lumps, then placed in an old gunny sack and broken to the desired fineness with an axe or mallet. From four to six pounds of salt will be ample. The freezer should be packed with ice and salt before the cream is added. Allow the cream to stand in the freezer for a few minutes, then turn the crank a few times. After standing a minute or two longer, freezing may be commenced in earnest. The crank should be turned slowly at first, gradually increasing the speed until a high rate is attained, when the turning becomes difficult. When the crank can scarcely be turned the dasher should be removed, the lid replaced on the can, and more ice and salt added. A stick of some sort should be used to pack the ice firmly around the freezer can. All the brine packing. The freezer should now be covered with a blanket and set in the cellar. Ice cream should always be allowed to harden. This process usually takes about six hours.

SOME DELICIOUS ICE CREAM RECIPES.

Plain vanilla ice cream is always a favorite. The following recipe will make about two gallons of ice cream: One gallon 25 p. c. cream, 1 pound 10 ounces cane sugar, 4-5 ounce vanilla extract. It may be difficult to measure the vanilla. If flavoring to suit the taste is done, the exact amount need not be measured. The sugar and vanilla are added to the cream before it is placed in the freezer. Only the highest grade of vanilla extract should be used.

Bale Your Hay and Hold It For Top Market Prices!

Baled hay can be stored in one-fifth the space required for loose hay. You can hold your entire hay crop till prices go up—then sell at the greatest profit. The difference between the price you get for loose hay near home and the top price you can get anywhere, for baled hay, quickly pays for an I H C hay press.

I H C Hay Presses

have many points of strength, simplicity, and convenience found in no other presses. They are equipped with a compound lever and a toggle joint plunger, which gives them their great compressing power. A 500 pound pull on the sweep of a 16 x 18 I H C press gives 76,800 pounds pressure in the bale chamber.

The bed reach is only about 4 inches high and very narrow. The bale chamber is very low—easy to reach over to tie the bale.

These presses are reasonable in price and are proved best by years of service. They are supplied to be operated with either one or two horses and the International Motor Baling Press is furnished with a 3, 4, or 6-horse power I H C gasoline engine—a hay press and portable engine in one.

Call on the I H C local agent for catalogue and prices, or, write nearest branch house.

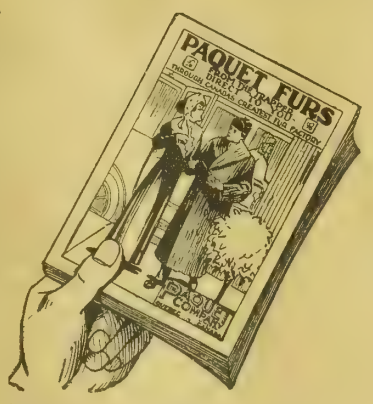
PAQUET FURS

The Connecting Link Between Trapper and YOU

CANADA'S Largest Fur Factory is the connecting link between the Trapper and YOU. Here we manufacture the famous PAQUET FURS, which are recognized as the Standard of Quality from Halifax to Vancouver.

And when we say "manufacture" we mean just that. We do not buy the skins ready dressed and dyed, and make them up at an enormous expense which you must help to pay. If we did, we'd have nothing unusual to talk about. We buy the skins in the raw—dress them and dye them ourselves—and then make them up in our own workrooms. This is the ONLY Fur Factory in AMERICA where every process, from dressing of the raw skins to the finishing of the Fur Piece or Garment, is in operation under the one roof.

We employ only the most modern processes of dying and finishing. Every member of our vast army of workers is an expert in his line.



This Handsone Fur Catalogue

containing 80 pages of illustrations and prices of PAQUET FURS, will be sent to you FREE upon request. This is the most beautiful Fur Catalogue ever published in Canada.

Write NOW !

This is because Fur has been to their fathers and grandfathers what it is to them—a life study. It stands to reason that with all our advantages we should turn out the very best Furs on the Canadian market, doesn't it ? And that we do is testified to by the thousands of Canadians who have spent to date more than EIGHT MILLION DOLLARS for PAQUET FURS. Quite a tidy little sum, isn't it ?

And what's more, every one of these purchasers is a satisfied customer.

In the past PAQUET FURS have been sold through the leading Fur Stores of Canada. The demand has now reached a point where more adequate distributing facilities are an absolute necessity. For this reason we have decided upon this new policy of selling direct to YOU at actual wholesale prices. This will enable us to keep our immense Fur Factory running at full capacity all the year round. It will also enable YOU to buy your furs at the lowest prices ever known in Canada.

Examine Them FREE

You don't need to send one cent in advance. Choose your Furs from our 80 page Fur Catalogue and we will send them PREPAID, for Free Examination to any Express Office in Canada. Pay the Express Agent our Catalogue Price and they are yours.

THE PAQUET COMPANY LIMITED.

QUEBEC, - Canada

The Set Illustrated, $25.00

No. 6145—Lady's "Olympic Stole in Black Russian Lynx (perfect imitation of genuine Black Lynx,) lined with plain Satin, Special **$12.50**

No. 2102—Lady's "Teddy" Muff to match, Black Russian Lynx, Satin lined, Special **$12.50**

The recipe for chocolate ice cream is as follows: One gallon 25 p. c. cream, 2 pounds sugar, 5 ounces bitter chocolate, 4-5 ounces vanilla extract. The chocolate is grated, heated with a small amount of milk until thoroughly dissolved, then cooled and added to cream.

Fruit ice creams are always acceptable. The following recipe may be used for making strawberry, cherry, peach or pineapple ice cream: One gallon 25 p. c. cream, 1 pound 10 ounces cane sugar, 1 pint crushed fruit. The crushed fruit may be added when the dasher is removed. This is the better procedure as the fruit may sink to the bottom of the freezer if added at the start. No trouble will be experienced in mixing the fruit with the ice cream if a long-handled spoon is used.

The recipes that have been given call for no starch paste or eggs or gelatin. None of the ingredients are cooked. The resulting product is wholesome and palatable. Once the housewife finds that good ice cream can be made without the preliminary bother that some deem necessary, the use of gelatin and eggs and starch will be discontinued.

SEALED TENDERS addressed to the undersigned and endorsed tender for Breakwater and Breastwork, Richibucto, South Beach, N. B., will be received at this office until 4 p. m., on Wednesday, September 27th 1911 for the construction of a Breakwater at Richibucto, on the South Beach. Kent Co., N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B., Geoffrey Stead, Esq., District Engineer, Chatham, N. B., and on application to the Postmaster Richibucto, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and place of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS.
Secretary

Department of Public Works.

Our Latest Booklet on

Ruberoid Roofing

Trade Mark Registered. Pronounce it RUE-BER-OID.

is entitled, "RUBEROID---WHY ?"

There's nothing dry or heavy about it. It's a breezy little story of some of the adventures of "The Ruberoid Man."

But at the same time you'll find it just as full of sound, common-sense roofing information as it is of interest.

Write to-day for a copy of "Ruberoid—Why ?" (No. 7)—it's free for the asking.

Have you ever seen "SOVEREIGN" Sheathing Felt ? If you haven't, ask for a sample of it, too.

Dealers Everywhere

Always the cookbook says:
"Sift Your Flour."

No lumps, you see. *Aerates* the flour, making it lighter.
Put FIVE ROSES in *your* sifter.
Never soft and sticky — never lumpy, musty, woolly.
Never *coarse.*
Milled superfine from *Manitoba's* grandest wheat.
Fine, *granular,* very dry.
Nothing remains in the sifter—FIVE ROSES is *free,* heavy.
And your bread is more *porous,* more yielding, more appetizing.
And more *Digestible.*
Because the particles are finer, *easier* to get at by the stomach juices.
Use this very fine flour—*superfine.*
FIVE ROSES. 19

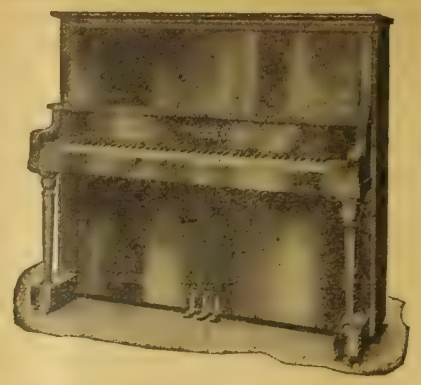
Contagious Abortion of Cattle.

This is a disease which is little understood and one with which every cattle raiser and dairyman should be familiar, as it is liable to be introduced into his herd, and failure to recognize it and to deal with it intelligently may result in great loss. The loss is not onlyone of death to the offspring, but also a loss due to the deminishing of the milk supply.

Abortion, "slinking," "casting," or "losing," are the terms applied to the act of expelling the foetus at any time before the normal period of pregnancy. The cause of this ill is bacterial, and according to eminent authorities any micro-organism causing an inflamed condition of the membrane of the womb is able to cause abortion, and shall be able to use more drastic preventative measures.

The disease is serious because it is spread by contact and by means of the discharges from the cow that has aborted, from the dead calf, and from the bulls which have served cows affected with the disease.

Don't Judge a Piano By It's Looks Alone



All Pianos look well. But if you buy a piano for looks alone, you make a mistake you surely will regret.

The first thing to be considered, when buying a piano is quality. Quality of materials, quality of workmanship and (most important of all)—tonal quality. Make sure of these first; then make sure its beauty of appearance will last.

Listen to the Sherlock-Manning Piano. Here is a piano whose rich, sweet, singing tone is a positive delight to the ear of all who hear it, and moreover will endure for years. Honesty in construction assures you of this. And its dainty appearance is all that could be desired.

There are six different designs to choose from. Let us send you our new catalogue giving full descriptions.

"If you do not know the Sherlock-Manning dealar near you, write us and we will gladly introduce you to him or we will give you full information by mail direct. You will save money by writing NOW for our catalogue."

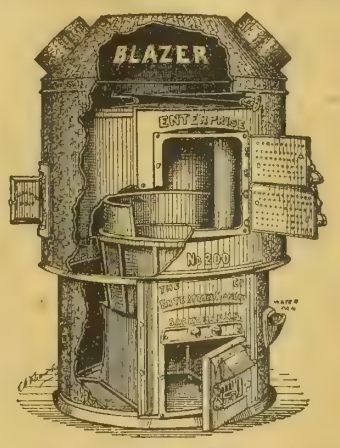
A Few Furnace Facts For The Farmer About the Enterprise Blazer Hot Air Furnace

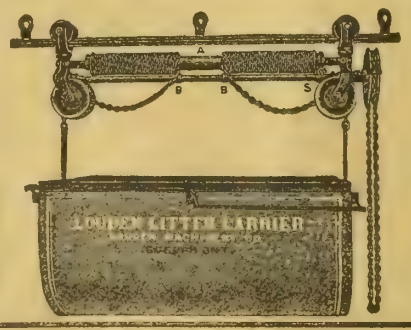


1. It burns hard coal, soft coal or WOOD.
2. It is the only furnace with the Fisher Patent Fire Pot.
3. It is made in four sizes and adapted for use in low cellars.
4. It is easily managed and absolutely free from gas.
5. It gives more heat with less fuel and care than any furnace made.
6. It is giving satisfaction in hundreds of private dwellings, stores, halls and churches throughout Canada.

Write for circular giving FURTHER FACTS about it; also booklet of reliable references. (We intended to publish some western references in this space, but have so many good ones it is hard to choose, so have put a few of them in pamphlet form. Drop us a card if you would like a copy.)

The Enterprise Foundry Co., - Sackville, N. B.

A GREAT LABOR SAVER



Louden's Litter Carrier does away with much of the drudgery of doing chores. A satisfied customer says: "does my heart good to see your carrier work. No more hard tugging. What a relief."

The cost of installing one of these is comparatively small and the labor saved soon pays for the outlay for equipment. Send us a plan of your stables and let us quote you a price.

LOUDEN MACHINERY CO., GUELPH, Ont.

Hay Tools, Feed Carriers, Cow Stalls and Stantions, Barn Door Hangers.

Have you talked with your neighbors about subscribing for THE MARITIME FARMER? Why not do it now? Make up as large a club of subsbribers as you can and send them in.

The disease occurs more frequently in dairy herds than in any others, although sheep, beef cattle and horses may become affected. The prevalence in dairy cows is probably due to the weakened condition caused by the continuous drain of giving milk and calving.

Means of prevention or cure must be taken and it is well for the inexperienced man to call a certified veterinarian, so that the farmer may learn the need of careful work in cleaning all infected places and also in learning the technique regarding the use of the syringe. After a few trials this manipulation will become comparatively easy, and he will soon learn to observe the necessary care in order to keep the disease n check.

TREATMENT OF SURROUNDINGS.

All cows that have aborted, or are expected to abort, should be isolated from the healthy herd at once. Immediately the cow aborts the offspring and afterbirth must be destroyed by burning, and the immediate surroundings treated with lime after the refuse has been burned; all wood-work should be disinfected by the use of corrosive sublimate (corrosive sublimate cannot be used on metal). This can be obtained with directions for use at any drug store. Ten days later disinfect again with corrosive sublimate.

TREATMENT OF COWS.

The cows should be syringed out daily with a one per cent solution of Creolin or Lysol until all discharge has stopped. It is a little risky using this treatment with pregnant cows, and in this case a tablespoonful of sodium hyposulphite should be given as a drench once every twenty-fout hours. These may all be obtained at any drug store.

Dynamite for Stumps.

A marked advance of dynamiting stumps over the old method of burning them out is that while burning destroys the valuable humus in the soil, thereby rendering it infertile, dynamite actually fertilizes the soil. When dynamite is properly used, little of the dirt is thrown out with the stump, and it is not necessary to clean the roots of earth or spend time in filling in a big hole, as in the case when a stump puller is used. The cost of clearing cut-over land with dynamite depends on the character of the soil and the kind and size of stumps. Results close to minimum cost were secured at the Long Island Railroad Company's experimental farm on Long Island. The average cost of removing 100 stumps was 16 cents each. Hand labor for pulling these stumps would have required three men 33 days at $1.33 a day or $131.67.

The comparison of time is also interesting, for while it would have required a whole day for two men to remove two stumps in the ordinary manner, a dynamiter and one helper blasted 157 stumps within the same time. The pulling of stumps requires at least two horses in addition to the services of the men, another saving effected by dynamite. The sprinkling of bowlders common to the Maritime hills has been responsible for many an abandoned farm. Now dynamite is disposing of these unwelcome obstacles. The three methods of bowlder blasting are mud capping, snake holing and block ho,ing. The quicker methods, though requiring more dynamite than block holing, are mud capping and snake holing. Mud capping is also termed "doby shooting" or "blistering," and the effect is of the crushing blow of an enormous sledge hammer.

THE ORIGINAL AND ONLY GENUINE

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

Cost of Horse Power.

The tradition that "It doesn't cost anything to keep a horse, when you live on a farm," is rudely shattered in "Bulletin No. 15," by Prof. Thomas P. Cooper, just issued by the Extension Division of the Wisconsin College of Agriculture. The writer shows that taking into account only such items as a city business man would consider in keeping a debit and credit account with a horse, every such animal really does cost the farmer a round sum for his keep.

First, there is the interest on the purchase price or selling value of the horse. Putting the rate at 6 per cent, and the value at only $150, the interest comes to $9.

Next, we must consider that the average working life of a horse does not exceed ten or twelve years; therefore, at least one-twelfth of his value must be annually charged to depreciation. There goes another $12.50 on the value of the $150 horse; and if the animal is worth $300, the depreciation cost is doubled.

The average duration of a frame barn, according to underwriters' tables, is 40 years, and the capital per head, invested in such structures, may be said to average $60. Divide this by forty, and we have $1.50 as depreciation and $3 as interest, making the cost of shelter for a horse per year, $4.50.

The items of use and depreciation of harness, shoeing and miscellaneous expenses add an average of at least $2.87 annually, and bring the total cost on the $150 animal up to $28.87. without any reference to the cost of feed and labor expended in caring for the horse.

Improvement of Sandy Soils.

Special studies have been begun by the Wisconsin experiment staeion to determine the best methods of managing the sandy soils which comprise 4,000,000 to 5,000,000 acres of the state. About 3,000,000 acres lie in the settled portions of the state and the rest in smaller areas in northern districts. To clear them is inexpensive but the fertility is easily exhausted. The addition of vegetable matter to sandy soils is very important since it is needed to increase their water holding capacity as well as to add fertility. Water is often the limiting factor in the production of sandy soils due to their coarse texture and lack of vegetable matter.

To prevent winds blowing sand the land may be laid out in long narrow fields with alternate grass and cultivated crops. Protection wind breaks of pines or other trees are effective for short distances. The fertility needs of sandy soils are nitrogen, phosphorus and potash. Phosphorus and potassium must be supplied either directly in commercial fertilizer or indirectly through the buying of feed which is fed to animals. The average sandy soil contains only one-third to one-half as much fertility as clay loams.

Legumes are beneficial to sandy soils because they supply the much needed nitrogen as well as humus Peat can be used to advantage as a nitrogen fertilizer where a supply is readily available. The use of lime on sandy soils, which are very commonly acid, wil, aid in securing a stand of alfalfa and clovers. Inoculation is also usually necessary to grow good crops of legumes. Rotations for sandy soils must be chosen so as to increase the amount of vegetable matter and provide a legume crop to cover the soil at least one in every three years.

WEAK MEN, READ

Perfect health and strength denote the absence of disease. When you are weak it means that you lack that which is the foundation of strength—of life itself—Electricity. You may be afflicted with Rheumatism, Dyspepsia, Lame Back, Weak Kidneys, Nervous Debility, Sciatica, Constipation or any of the numerous diseases which lead to an early breaking down of the system. If you have any of these troubles they should be attended to at once. You have tried drugs, and found that if they even stimulated you they did not cure, but left you with some new trouble as a result of the poison they put into your system.

It is pitiable to think of the vast number of men who go on from day to day suffering mental and physical torture as a result of their weakness, while right at their doors other men are being cured of the same disease. One who has not known it himself cannot realize the feelings of a man in an advanced stage of Nervous Debility, nor does he hear it, for these men do not talk of their troubles. Even when they are fortunately led to use the remedy which is now so well known—Dr. McLaughlin's Electric Belt—and are cured by it, they do not mention it to their closest friends; hence the prevalence of this trouble, and the means of cure are appreciated only by those who have had experience. And yet I have thousands upon thousands of grateful patients who are willing to testify to their cures by

Dr. McLaughlin's Electric Belt

and who would be glad to share their knowledge with others if written to. I send the names of these men to any one who requests them. There is not another remedy in the world to-day that has proven as effective. Its cures speak volumes for the good work it has accomplished. My confidence in my method enables me to offer to any man or woman who will offer me reasonable security to use the Belt at my risk and

THIS BOOK FREE

PAY WHEN CURED

If I don't cure you my Belt comes back to me, and we quit friends. You are out the time you spend on it—wearing it while you sleep—nothing more.

Cured of Sleeplessness and General Debility

M. A. McLaughlin:—

Dear Sir,—The Belt I got from you a short time ago, is satisfactory in every respect, for which I am very thankful. Yours truly, C. C. Rolfe, Bishops Crossing, Que., July 26, 1911.

Cured of Lumbago

M. A. McLaughlin:—

Dear Sir,—I write to let you know of the success of your Belt. Before getting it, some of my friends tried to persuade me that I was foolish to get one. But I had a sort of faith that the belt would help me, and it has. For two months before I got your Belt, my wife had rubbed my back night and morning, with all kinds of liniments, salves, etc., most all of which I got from local doctors. Since I have used the Belt, all the hand rubbing has ceased, which has been a great comfort to my wife and myself. I had Lumbago, and I had it probably worse than you suspected. Yours respectfully, Fred Clapham, Plaster Rock, Vic. Co., N.B., July 13, 1911.

Belt Cured Where Doctors Failed

M. A. McLaughlin:—

Dear Sir,—I have worn your Electric Belt for about three months now, and must say that it has done wonders for me. I have had doctor after doctor, and they have failed to do me any good whatever. Therefore, I must say, that I cannot recommend your Belt too highly, and I intend, that wherever I may go, or whoever I may come in contact with, to recommend it as a sure cure. Sincerely yours, Herman O. Cook, Yarmouth, N.S., July 4, 1911.

Belt Gave Entire Satisfaction

Dear Sir,—Received your letter of the 4th inst., and in reply I can say that your Belt gave entire satisfaction. With best wishes, I am, Sir,—Yours very truly, Ernest Ryerse, 106 Queen Street, St. John, N.B.

I cannot take up more space with these extracts, but if you will send me your address I will mail you free my beautifully illustrated book, along with testimonials from thousands of grateful people, who have been fully restored to health and strength.

This appliance has cures in almost every town and city in the country, and if you will write me I will send you testimonials given to me by people that are probably well known to you. My Belt not only cures weakness, but Rheumatism, Sciatica, Lumbago, Backache, Kidney Trouble, Nervousness, Constipation, Indigestion and Stomach Trouble. I have a beautiful 80-page illustrated book, which I will mail, sealed, to any address, FREE. This book is full of lots of good, interesting reading for men. Call to-day. If you can't call, send coupon for Free Book.

M. K McLAUGHLIN,
214 St. James St., Montreal, Que.

The Universal Favorite

Is a High-class Family Steel Range, honorably built of the best material, and put together as tight as a steam boiler, and is guaranteed to cook and bake perfectly.

NOTE:—The spacious fire box for wood.
The large fire box opening, 7½x8½ inches.
The roomy square oven.
The top-hinged key plate.
Also note how easily the coal grates can be removed.
The linings can be changed from coal to wood, or vice versa, without the disturbing of a bolt.

There are thousands of Universal Favorites in the homes of our farmers, making cooking and baking a pleasure and the kitchen work easy and light.

THE UNIVERSAL FAVORITE is specially built to meet the requirements of farm homes. The top is large and roomy with six pot holes, the oven will bake sixteen loaves of bread in pans 4 1-2x10 inches at one time. The fire box for wood is 29 inches long, and will burn coarse wood of any kind

NO RISK IS TAKEN, as an unqualified guarantee goes with every UNIVERSAL FAVORITE that it will cook and bake perfectly.

The Universal Favorite is procurable from a dealer in your market town. Manufactured by,—

FINDLAY BROS., CO. Ltd., Carleton Place, Ontario.

H. H. DRYDEN Sussex, N. B., Representative for Maritime Provinces.

Growth and Decay in Horses.

(Continued from page 864.)

and three years was on an average 1 in., between three years and four years one-third of an inch, and between four years and five years one-third of an inch. Some of the horses did not grow.

"Of thirty-five two-year-olds, two did not grow during the year.

"Of 144 three-year-olds, seventeen did not grow during the year.

"Of forty-eight four-year-olds, seven did not grow during the year.

"Of eleven five-year-olds, two did not grow during the year.

Smith considers that these numbers are too small to generalise from, but says "there can be no doubt that many horses grow more than two-thirds of an inch between three and five years old," and that it is probable many grow up to their sixth year.

On the subject of decay the same authority says:—"It is doubtful what age a horse would live to if not subjected to civilization, but we may safely say that at seventeen years old the powers of life in the majority of them are on the wane, though many at this peroid may be found in full possession of life and vigor. There are probably cases of the survival of the fittest, and cannot be taken as a general guide.

"Doubtless the work performed by horses is the chief cause of their rapid decay; but apart from this, changes in their teeth, such as the wearing away of the molars, appear to preclude many of them from reaching a ripe old age, though instances are on record of horses attaining the age of thirty-five, forty-five, fifty and one animal is known to have lived to sixty-two years of age." Much, of course, depends on the age of which horses are put to work, the kind of work they do, and the care taken of them before maturity, as measured by the time completion of permanent dentition is reached. A good many are worn out before they reach their prime, owing to early and over-work, but this result is the only one to be expected where the bones, joints, and muscles are not "set." M.R.C.V.S.

Chatham and Alfalfa Notes.

Editor, Maritime Farmer.

It was my pleasure recently whilst in Chatham to have the privilege of visiting some of the farms in that locality. The first one visited was that of Mr. Geo. E. Fisher, the man who has made Chatham's 1911 Exhibition such a grand success.

After looking over the fields that bear every evidence of having done their share in filling the hay mows we went over the market garden. Here amongst other quantities of vegetables was three quarters of an acre of different varieties of tomatoes, and every plant loaded with fruit.

Mr. Geo. Fisher has not only made commercial gardening a success, but his dairy business is probably the best equipped in the Province.

For labor saving devices for the feeding and caring of his pure-bred Ayrshire herd the barns cannot be equalled. "Woodburn Farm" has the imprint of success, energy and brains stamped upon it.

ALFALFA.

The best field of Alfalfa we have seen in the Province was that of Mr. R. A. Snowball. Some six or seven acres had been seeded down seven years ago, and it was now cutting two or three crops a year according to the season. Mr. Snowball informed us that he was only successful after a number of trials, and has every reason to believe it is now firmly established, as all the roots are covered with nodules, and the deep green of the field indicates its healthy condition.

In this field too was fifteen acres of the finest stand of clover one could wish. Not a bare spot was to be seen, and a growth of some nine inches would give an approximate idea of the amount of hay that this field will furnish next season.

Mr. Snowball says he never sows any grass seed now, as he is getting better returns by sowing clover. He never misses a catch as his land is in good shape, and his crops following clover cannot be beaten.

Mr. Snowball's farm shows what the County of Northumberland can do by proper methods of agriculture.

ALFALFA AGAIN.

The farm of Mr. Seely was visited at Havelock, Kings Co., and the success that Mr. Seely is making of Alfalfa is a credit to him, and thesight of his three half acre plots must be a standing inspiration to the farmers of that district. One plot that was started three years ago will cut its third crop this year, and after being cut twice stands over a foot high at time of writing. Like others Mr. Seely attributes his success to repeated efforts in spite of failures, and now he is rewarded by a perfect stand of this famous forage plant, which he feeds to his horses, cows pigs and chickens. Lime rock is found in large quantities in the soil here, and it is not unlikely that Havelock may become one of the largest Alfalfa producing sections in New Brunswick.

Farmer Representative.

Keep Chickens out of Barn.

By the first of November, if not sooner, the chickens on any farm should be trained to roost at night in the hen house. In the summer time the young chickens were raised in small coops in the chicken yard and of course were accustomed to stay there at night, but along in the fall they should be trained to go to the chicken house. It will require patient effort to get all the straggers gathered up, and it may be several weeks before it will cease to be necessary to go out at night and catch those that have not learned the proper place to roost.

Many persons neglect this and as a consequence their chickens roost any place, in the trees and on the fences as long as the weather will permit, and when it becomes necessary to seek shelter they go to the outbuildings and sheds, and especially to the barn. They are attracted to these places on account of the grain they can find and at night they fly up on the nearest place and go to roost. One can go into many barns after night and find chickens roosting on the pieces of machinery, if any are kept in the barn, on the mangers, the stalls and on the harness where it is hung up on the pegs. As a result the whole place and everything in it is soon in a filthy condition. Some persons are evidently so accustomed to this condition of affairs that they are unconscious of it and the same thing goes on year after year.

It occasionally happens that the droppings are allowed to accumulate in the chicken house until it gets in such a filthy condition and becomes so infested with lice that the chickens are compelled to seek another roosting place on this account. Now, if any man who is disgusted at having the chickens roost in the barn and does not know the reason will examine the chicken house he may possibly find the solution of the problem. Very likely this place requires a thorough cleaning and possibly a coat of whitewash to make it a fit place for the chickens to stay in. It will also add to the comfort of the fowls if the loose boards are fastened on to keep out the cold wind and if the openings in the roof are mended.

If a suitable place is provided for the chickens and they are trained to roost there the owner will have no more trouble with his chickens staying in the barn, for at night every one will be in its place in the coop.—

Margaret Whitney.

Prize Winners at the Fredericton Exhibition.

Sussex Wood Cutters

Made in Three Different Sizes :

Long Swing, Short Swing and Flat Rolling Table Machines

The frame is built of the best seasoned hardwood and braced with steel bars. The table is made of heavy steel plates. The arbor is of the best turned Steel and runs in bearings of the best babbit. The balance wheel is a solid web and weighs 180 lbs. These are very important points to consider in selecting a wood cutter.

The distance between the balance wheel and saw in both the Long Swing and the Flat Rolling Table machines is 4 ft. 3 in. The distance between the balance wheel and saw of the Short Swing Table machine is 3 ft. 6 in.

The Machines are fitted with either 26, 28 or 30 in. saws. Each Wood cutter is tested before it leaves the factory.

The Cow That Will Come Fresh.

(Continued from page 853)

feeds, such as well-cured roughage, and omit more of those which are of a relaxing nature; oats, oil-meal, etc. If dysentary sets in, reverse the order of feeding, giving oats, oil-meal, and those articles of feed which loosen the bowels, leaving off the dry roughage and feedstuffs that tend to check or hinder thorough digestion and assimilation.—M. Coverdell, Worth Co., Mo.

Insuring the Safety of Little Ones.

Thoughtful people, in the place of worrying over the decrease in the number of births, are urging that better care be given the children that are born so that a larger per cent reach maturity than has been the rule in the past.

In this connection we cannot enter into all the different divisions of intelligent care of children, for space is too limited, but we want to urge that care be exercised so as to prevent the accidents which are so common and which frequently result in death. There is scarcely a daily paper that does not furnish some harrowing tale from town or country of little lives sacrificed through carelessness or neglect of those who have the little ones in charge. Some of these, and by far the greater number were preventable, while a few were unforseen but should serve as a warning to others.

The number of little lives lost in a year by fire would be appalling if we had any record of them, yet mothers will go on leaving their little ones with open fires in the room where the children are, or with lamps to be overturned, or matches within reach, and no older person present. Not infrequently the helpless little ones are locked in to keep them safe, and often both home and children are lost.

Poisonous drugs are left where children can reach them, and the same is the case with lye and fly poisons and other instruments of death. Firearms are also carelessly left loaded and have their share of fatalities charged to them, though it is not they nor any of the immediate causes of death that are to blame, the carelessness of someone being alone responsible.

Why the Boy Should Stay on the Farm.

Editor Maritime Farmer:—

The boy should stay on the farm when his parents require his services because it is his duty to do so. The Bible says:—"Honor thy Father and Mother that it may be well with thee and thou mayest live long on the earth", Ephesians 6, 2-3. Of course you boys have read that Commandment but probably you have almost forgotten it, but it is there alright and should be strictly obeyed. Now when a boy is kind and considerate and does everything in his power to promote the welfare and happiness of his parents and stays With them on the farm why of course he honors them there is no question about that. They have good reason to be proud of their dutiful affectionate son. He is obeying one of the Commandments and What is the promise? Here it is: That thy days may be long. Isn't that grand? Surely every person wants to live to a good old age. But where under the sun are we so likely to live as long as on the farm? Farming is pleasant, healthful and profitable work. This statement has been proven hundreds of times. How the pent up citizen envies the happy looking farmer when he is riding around his broad fertile fields driving his team. He is breathing the pure health giving air while pursuing his vocation. See how strong and robust he is and how he enjoys his work. This is a pen picture of the boy who honors his parents. He is doing right and Right shall triumph.

Another reason why the boy should stay on the farm is that there is plenty of money to be made in the Maritime Provinces. Many a young man goes to the States leaving his parents to get along as best they can. But in many instances he is sorry he left home. He soon finds that although wages are higher there expenses are higher also. And there are temptations on every side. He soon finds that he can save very little more than he could at home. And he has to work much harder. It is rush, rush all the time in Boston and New York. How the boy sighs fo! the free healthful life on the old farm surrounded by his loving parents and fond brothers and sisters. Like the prodigal he longs to return home and ask his father's forgiveness.

Yes, boys stick to the farm if you wish to become wealthy. If you are a good manager, industrious and economical, if you have grit ambition and determination you will soon mount up on the pinnacle of success. Make the decision at once and you shall never regret it. Be kind to your parents and when they have gone to their long home your conscience will not upbraid you for having grieved their loving hearts.

Settle down on the dear old farm.
Yes, in our lovely native land,
You may soon find a charmer,
And live and die a happy man,
An independent farmer.—Mrs. Annie Rodd, P. E. I.

Cutting Down on Grain Foods.

Farmers and feeders make a serious mistake when they cut down on the amount of grain food that they feed their dairy cattle and fattening animals during the winter. There may be some animals on the farm that can be carried along through the winter on moderate rations but dairy cattle and fattening stock do not belong to that class.

The farm teams that are not being worked, do not require a full ration of grain feed during the winter, but it is costly economy to rough them through the winter on short rations. The horse that is allowed to run down in flesh condition cannot do as efficient service during the spring's work as he could if he were well fed during the winter. No man ever made more money feeding live stock just enough to keep them alive.

In feeding fattening stock and dairy cows, gain and profit come in proportion to the amount of food the animals put to use. The fattening animals and dairy cows should have no set-backs; and the best feeders know when to feed high priced grain foods and are not afraid to feed full rations.

Dairy cows should have rich and liberal feeding every day. If they are allowed to shrink in their flow of milk it requires weeks to get them back to their normal condition and milk yield. Regular and liberal feeding are two things that must not be neglected and no man can make money out of live stock who conducts his feeding on any other basis.—J. Milton Kelly.

Will Come Back to Canada.

Editor Maritime Farmer:—

I will miss seeing you at the Fairs this year as I am away down in Dixie land, as manager on a 10,000 White Leghorn plant. Frank my son, works with me—all my other help are colored men. I like the South very much. We find it pretty hot still we have nice cool nights. My work is not as hard as when I was with the Hartland Poultry Yards. The South has been going ahead the last few years very fast. We are quite near the city of Birmingham with a rapidly increasing population of 135,000, still I don't want to make my home down here. I intend to stay here long enough to make a little money and go back to good old Canada.

I am sending you a few pictures I snaped which may interest you. I Wish you would send me the Maritime Farmer for one year beginning with the Halifax Exhibition number. Send bill and I will remit as I want to keep in touch with farm matters in the Maritime Provinces.—C. W. Hurst.

Increase of Weeds.

The enormous increase which results from allowing weeds to seed may be seen from the following short list, showing the number of seeds each of the weeds named is capable of producing in a single season:—

	No. of seeds on a single plant.
Groundsel	6,500
Corn cockle	2,590
Red poppy	50,000
Charlock	4,000
Sow thistle	19,000
Blackhead	3,000
Shepherd's purse	4,500
Cow parsnip	5,000
Stinking camomile	40,000
Ox eye daisy	13,500
Burdock	24,520
Common dock	13,000
Dandelion	2,040

MARKETS

St. John Prices.

FLOUR AND MEAL—Ontario patents are up to 15c., oatmeal 25c., and cornmeal 15c. Hard wheat patents, $6.20 to $6.25; choice patents, to $5.45; oatmeal, $5.75; cornmeal, $5.55 to $5.60; medium patents, $5.40

PROVISIONS—The only change is an advance of a quarter cent in compound lard. American clear fat pork $20.50 to $23.00; domestic mess pork, $22 to $23; American plate beef, $17 to $18; lumbermen's XXX, $15.25; pure lard, tub base, 12½cts. to 12¾c.; compound lard, 11c.

BEANS—The market is unchanged at $2.50.

PRODUCE—Cheese has advanced a little and is now quoted at 15c. to 15¼c. Butter is steady at 20c. to 22c and eggs at 22c. to 23c.

Charlottetown Prices.

GRAIN—Oats, White 40; Black40 to 42.

FEEDSTUFFS—Bran, $1.30 to 1.35; Shorts, 1.40 to 1.50; Middlings, 1.45 to 1.50; Oil-cake, 2.25 to 2.50; Corn Meal, 1.75 to 1.85.

GRASS SEEDS—Timothy, 12c. to 13c.

LIVE STOCK—Butcher's Cattle,4¾ to 5¼; Stockers, 18 to 30.00; Milch Cows, 25 to 50.00; Sheep, 4¼ to 4¾; Lambs, 5 to 5½.

DRESSED MEATS—Beef (carcass), 8 to 10½c.; Beef (retail), 10 to 16c.; Mutton (carcass), 9 to 10c.; Veal (carcass), 5 to 5½c.; Lamb (carcass), 12c.; Pork (carcass), 8½c.

HORSES—Drafters, $175 to $200; Roadsters, 175 to 225; Carriage, 175

DAIRY PRODUCTS—Creamery butter, 24 to 25c. Solids, 24½ to 26c. Prints; Dairy Butter, Tubs, 19 to 21c., Prints, 20 to 25c.; Cheese, 14 to 14½c. Twins, ½c. more.

POULTRY AND POULTRY PRODUCTS—Eggs, 19½ to 20c.; Fowl ,10 to 12c.; Chickens, 75c. to 1.00 pair; Ducks, 80c. to 1.25 pair.

FRUIT—Apples, 1.00 to 3.00 barrel; Plums, 7 to 9c. per quartf

MISCELLANEOUS—Hay, 10.50 to 11.00; Straw, 5.00; Wool, 23 to 25c.; Beef Hides, 10 to 10½c.; Calf Skins 13 to 16c.; Sheep Skins, 40 to 60c.; Lamb Skins, 40 to 60c.

VEGETABLES—Carrots, 40c. per bus.; Potatoes, 35c. per bus.; Turnips 20c. per bus.; Beets, 40c. per bus.

Market is quiet and prices firm. Produce is moving slowly and the rush of shipping will not be on for some little time yet. Hay and Oats are both short but Root Crops are good. Apples are plentiful and market overstocked with early kinds. Butter is firm and high and Cheese is out of sight. 14c. was bid on Board yesterday with no sales and we know of one factory which sold at 14½c. afterwards. Eggs are higher also but market is well supplied and it is not easy to place large shipments at a profit over prices now being paid to country shippers.

Halifax Prices.

BREADSTUFFS AND FEEDS—This department of trade is characterized by considerable strength. The grain markets to begin with exhibit considerable strength all through the list, and all classes of breadstuffs and feeds naturally follow suit. In Ontario the millers have put up flour prices about 50 cents a barrel, but this movement has not as yet been reflected in local wholesale prices. The bean situation, due to damage by frost, is very strong, and the advances in Ontario have been followed by an advance of 15 cents a bushel in Halifax. Oatmeal and rolled oats likewise follow the advances in these commodities at milling points. Owing to short oat crops both in Canada and the United States millers are very firm in their attitude; indeed, prices are now about a dollar a barrel higher than the lowest point of the past season, and with present prospects in the oat market the trade are now led to expect declines very soon. Feeds of course, follow the grain markets, and as the supplies of mill feeds are very much restricted, there is no expectation of any thing but firm and high prices. The demand for feeds seem to be quite in excess of the offerings.

Oatmeal Standard, in bbls., 5.85 to 5.90; Oatmeal Standard, in bags, 5.65 to 5.75; Rolled Oats, in bbls., 5.30 to 5.40; Rolled Oats, in bags 5.10 to 5.20; Middlings, 27.50 to 28.00; Bran, 25.50 to 26.00; Shorts, 26.50 to 27.00; Feed Flour, bag 98lbs. 1.70 to 1.75; Cornmeal in barrels, 3.40 to 3.50; Cornmeal in bags, 1.65 to 1.70; Feed Oats in bags, 55c. to 57c.; Hay, 12.00 to 13.50; Creamery Prints 29cts. per lb.; Creamery Solids, 28c. per lb.; Dairy Solids, 22cts. per lb.; Cheese, Twins, 15cts. per lb.; Cheese, Large, 14½cts. per lb.; New Laid Eggs, 24cts. per dozen.

GREEN FRUITS AND VEGETABLES—The prices of apples are very low owing to the large supply of Gravensteins and the difficulty the fruit growers experience in marketing them. When these large supplies are cleaned up the market will be in a healthier state. Potatoes are somewhat scarce in this market. Deliveries from the Island for some reason have been disappointing as to volume and the Nova Scotia crop is said to be rather smaller than usual. The market is well supplied with fruits and vegetables generally.

FRESH MEATS AND POULTRY—The local butchers are using provincial cattle chiefly these days. They say there is a fair supply. There is also a fair supply of lambs, but there is no export supply at the present time. There is usually a surplus of about ten to fifteen thousand lambs that find their way to the American markets. In case reciprocity went through it was expected the market would be firmer, for the duty there amounts to about 1c. a pound dressed; but as things stand now prices are more likely to be easier later on. Pork is very plentiful just now, but presently, with colder weather, shipments from Island points will commence, and prices may then be easier. Hog raising has been carried on very extensively during the past season.

Fowls, per lb, 13 to 15 cts.; Turkey per lb. 18cts.; Chickens, per pair,70c. to 1.00; Ducks, per lb. 15 to 18cts.; Beef, per lb. 9 to 10½cts.; Mutton, per lb., 8 to 9cts.; Veal, per lb., 7 to 8cts.; Pork, per lb. 8½ to 9cts.; Lamb per lb. 9 to 10cts.

MONTREAL BUTTER MARKET.

Choicest butter was selling in Montreal yesterday at 25¾c. to 25c., with seconds 25¼c. to 25½c.

The receipts of butter in Montreal during the week ending the 20th, according to the Trade Bulletin, were 16,104 pkgs., against 15,628 for the week previous, and 12,500 for the same week last year. The exports last week were 8,736, against 840 last year.

POTATOES AND VEGETABLES.

Potatoes are selling in Torpnto at $1.15 a bag.

Spanish onions sell at $3.50 a case, and Silverskins 50c. a basket. Pickling onions are $1 a basket.

Cucumbers are selling at 35c. to 50c. a basket, pickling cucumbers $1 to $1.15 a basket, and ghekrins 60c. to $1.25.

Tomatoes are 25c. to 35c. a basket.

Green peppers are 50c. and red 75c. a basket.

Cauliflowers are $1 a doz., and corn 12c. a dozen.

WOOL IN TORONTO.

E. T. Carter & Co. quote unwashed wool at 13c. to 14c., washed 19c. to 21c. and rejects 15c.

Paint your barn

DEPARTMENT OF RAILWAYS AND CANALS.

Intercolonial Railway.

Spur Line--Hampton Station to Hampton Village, N. B.

2nd NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Hampton Spur Line," will be received at this office until six o'clock on Saturday, 7th October, 1911.

Plans, profiles, specification and form of contract to be entered into can be seen on and after this date at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, at the office of the Chief Engineer of the Intercolonial Railway, Moncton, and at the office of the Intercolonial Terminal Agent, St. John, N. B.

Parties tendering will be required to accept the fair wages schedule prepared or to be prepared by the Department of Labour, which schedule will form part of the contract.

Contractors are requested to bear in mind that tenders will not be considered, unless made strictly in accordance with the printed forms, and in the case of firms, unless there are attached the actual signature, the nature of the occupation, and place of residence of each member of the firm.

An accepted bank cheque for the sum of $5,000.00 made payable to the order of the Minister of Railways and Canals must accompany each tender, which sum will be forfeited if the party tendering declines entering into contract for the work, at the rates stated in the offer submitted.

The cheque thus sent in will be returned to the respective contractors whose tenders are not accepted.

The cheque of the successful tenderer will be held as security, or part security, for the due fulfilment of the contract to be entered into.

The lowest or any tender not necessarily accepted.

By order
L. K. JONES,
Secretary.

Department of Railways and Canals,
Ottawa, 20th September, 1911.

Newspapers inserting this advertisement without authority from the Department wil not be paid for it.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Wharf at Shediac Island, N. B." will be receivsd at this office until 4.00 p. m., on Tuesday, October 17, 1911, for the construction of a Wharf at Shediac Island, Westmorland Co., N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department and at the offices of Geoffrey Stead, Esq., District Engineer, Chatham, N. B., E. T. P. Shewen, Esq., District Engineer, St. John, N. B., and on application to the Postmaster at Shediac Is and, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation. and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, equal to ten per cent (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order
F. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, September 18, 1911.

Newspapers will not be paid for this rdvertisement if they insert it without authority from the department.

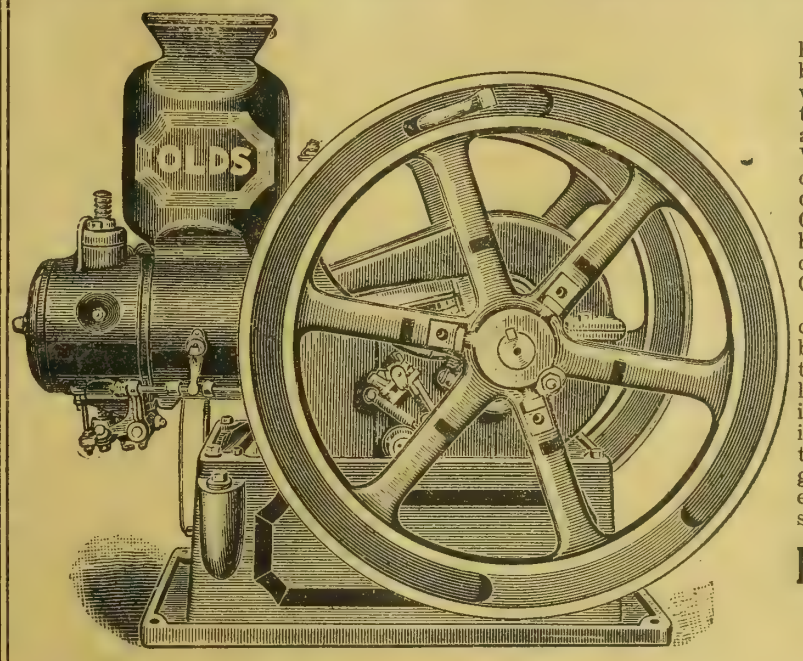
IMPORTANT ANNOUNCEMENT



We are pleased to announce that we have completed arrangements whereby we become the sole SaleRepresentatives for the well known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works---which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which the Gosoline Engine can be put to are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later---but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

Massey-Harris Co., Limited

Moncton, New Brunswick.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

1st, J. Scott.

Make Your Hens Lay by Keeping them Well

Fowls with their crops full of *fermenting* food cannot be healthy. They cannot *tell* you that there is trouble with their digestion. The first you learn of it is by seeing a lot of sick, unprofitable birds on your hands.

Leading Poultrymen Feed

"Esso" Chicken Charcoal.

Those poultrymen who are making a success today feed "Esso" Chicken Charcoal to their flocks *regularly*. From the time the chicks are first fed, it is *kept before* them; and this means healthy, contented, *profitable* birds.

Stop in and get a copy of our free book, "The Value of Charcoal in Poultry Raising," and learn more about "Esso."

YOUR NAME HERE.

For Sale--Exhibition Poultry at a Bargain.

To make room for our young birds we will sell one or more of the poultry that has made such a grand winning for us at Halifax, Chatham, Fredericton, Woodstock and Centreville. Special bargains in cocks and cockerels, in Plymouth Rocks, Barred, Buff and White. Wyandottes, Golden, Silver, Buff and Black. Leghorns. Black, Buff, White and Brown, R. C. and S. C. R. I. Reds, Anconas, Brahams, Cochins, Houdans. Faverolles, Hamburgs, White and Black Minorcas Polands, Spanish Bantams, Ducks, Geese, Guineas and others. Write at once if you want any.

Hartland Poultry Yards, - - Hartland, N.B

Fibrous Enlargement on Hoof.

Ihave a mare five years old that has a lump on outside front of her right hind leg. It is in the flesh and extends from the hock downwards about four inches. It seems to be getting larger. The mare is not lame. Kindly advise.—C. L., Ont.

The enlargement on the anterior, external or outer part of the hock is of a fibrous nature which will grow to a limited extent; as a rule, however, the enlargements can be reduced by repeated embrocations which have a tendency to absorb.

Treatment.—Clip the hair off closely and apply the fol,owing blister: Biniodide of mercury, 1 1-2 drachms; powdered cantharidies, 1 1-2 drachms; lard, 2 ounces; mix well together and apply with good friction for 30 minutes on the enlargement in order to THE "SILVER LEAF" DISEASE have a strong penetrating action. The enlargement can be touched up slightly the fol,owing day with the blister. When the blister is acting, tie the mare's head up so she cannot bite the blistered part. In 24 hours' time a little lard can be applied over the blister and the mare's head can be loosened so that she can move about and lie down. Lard should be applied on the enlargement once daily till the scurf comes off and the hair commences to grow. The blister can be repeated every three to four weeks until the enlargement is to escape, after which the wound can be treated in the usual manner, using warm water fomentations and antiseptic lotions.

SEA VIEW STOCK FARM

Bouctouche, N. B.

Municipal Bonds

of any town or city in the Maritime Provinces are just as safe as money in the Bank.

Many of the bonds we are offering are even safer because the security behind them is greater than the capital stock of many of the banks in which your money is deposited,

Instead of earning only 3 p. c. put your money into Municipal Bonds which will yield you 4½ p. c. with absolute safety.

Let us send you our list of absolute safe Municipal Bonds which will yield you 50 p. c. more interest than you can get on bank deposits.

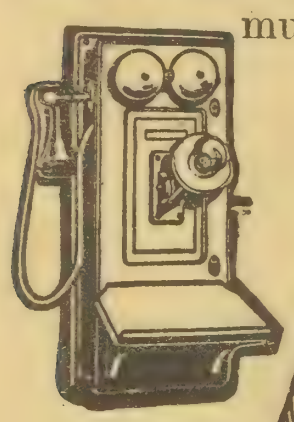
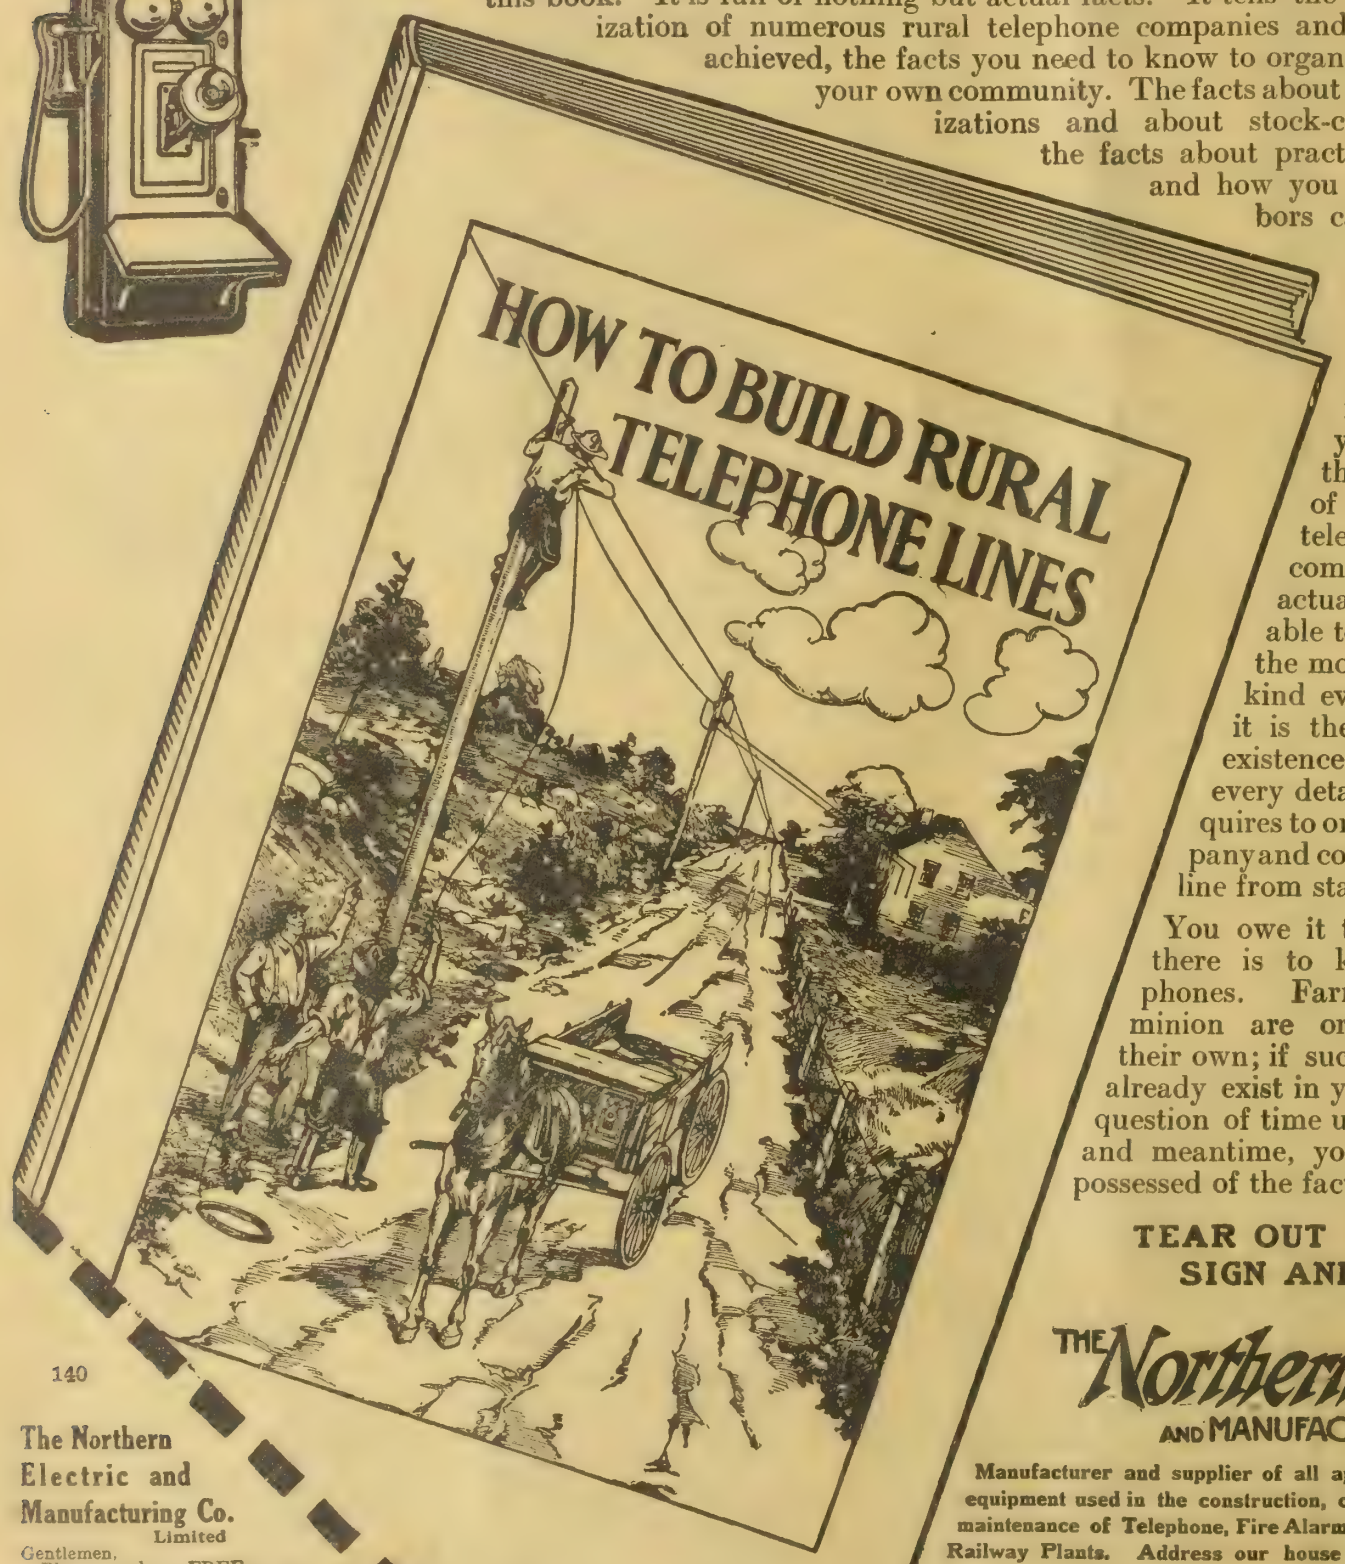
WE SEND THIS 100-PAGE CLOTH-BOUND VOLUME SEND US THE COUPON TO-DAY FREE

YOU only need to tear out the coupon, fill it in and mail it to us to get this book. "How to Build Rural Telephone Lines" is a stiff-covered, cloth-bound book of 100 pages, crammed full of hard facts about the building of community-owned telephone lines. There is no theory—no clever writing in this book. It is full of nothing but actual facts. It tells the facts about the organization of numerous rural telephone companies and the success they have achieved, the facts you need to know to organize such a company in your own community. The facts about mutual-company organizations and about stock-company organizations, the facts about practical construction work and how you and your own neighbors can do this construction, the facts about the equipment necessary, the facts about government regulations on the matter—in short, it tells you every fact you need to know, from the moment you dream of the possibilities of a telephone system in your community, until the line is actually erected and you are able to talk over it. This is the most complete book of its kind ever published anywhere; it is the one single volume in existence that gives the farmer every detail of information he requires to organize a telephone company and construct a rural telephone line from start to finish.





You owe it to yourself to know all there is to know about rural telephones. Farmers all over the Dominion are organizing companies of their own; if such a company does not already exist in your locality, it is only a question of time until one will be formed and meantime, you should be becomin possessed of the facts.
